Civil War Cartography

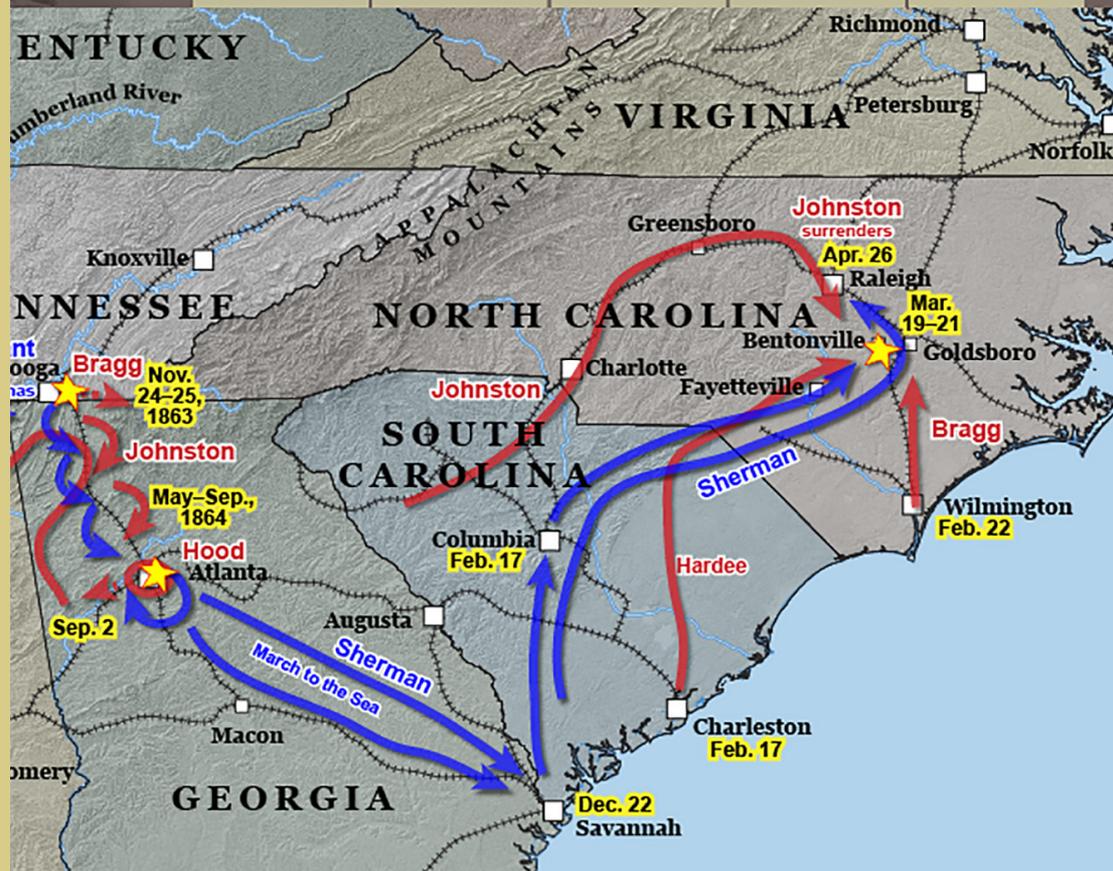

A presentation to the
Old Baldy CWRT

Hal Jespersen

www.posix.com/CW

or www.cwmaps.com

January 10, 2019

Outline

- My history in mapmaking
- Famous cartographers who influenced me
- How I work with authors
 - Determining content
 - Publication challenges and issues
- My mapmaking tools and workflow
- Technical aspects of cartography: projection, elevation, data sources
- Accuracy of 19c maps

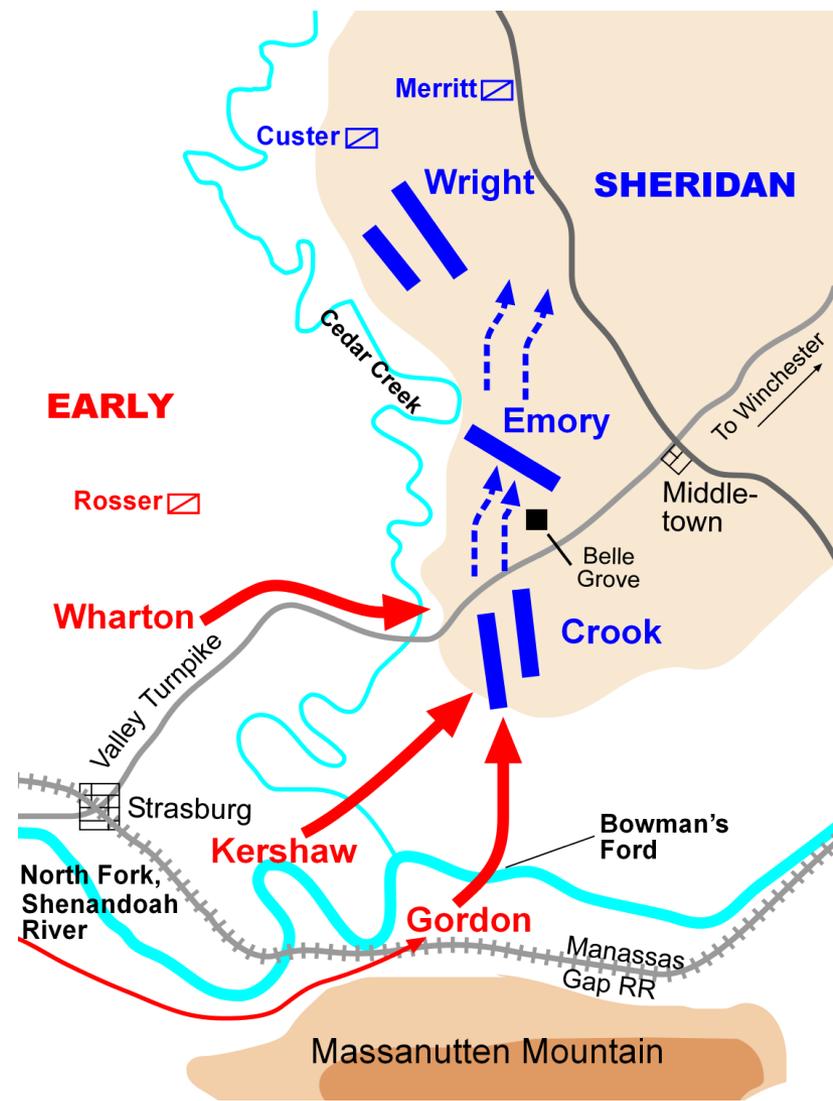

Hal's Civil War Mapmaking

- Creating maps since about 2005
- Now a full-time hobby/business in “retirement” from the computer business
 - Over 3,000 maps for Wikipedia, books, presentations, displays

My Early Work

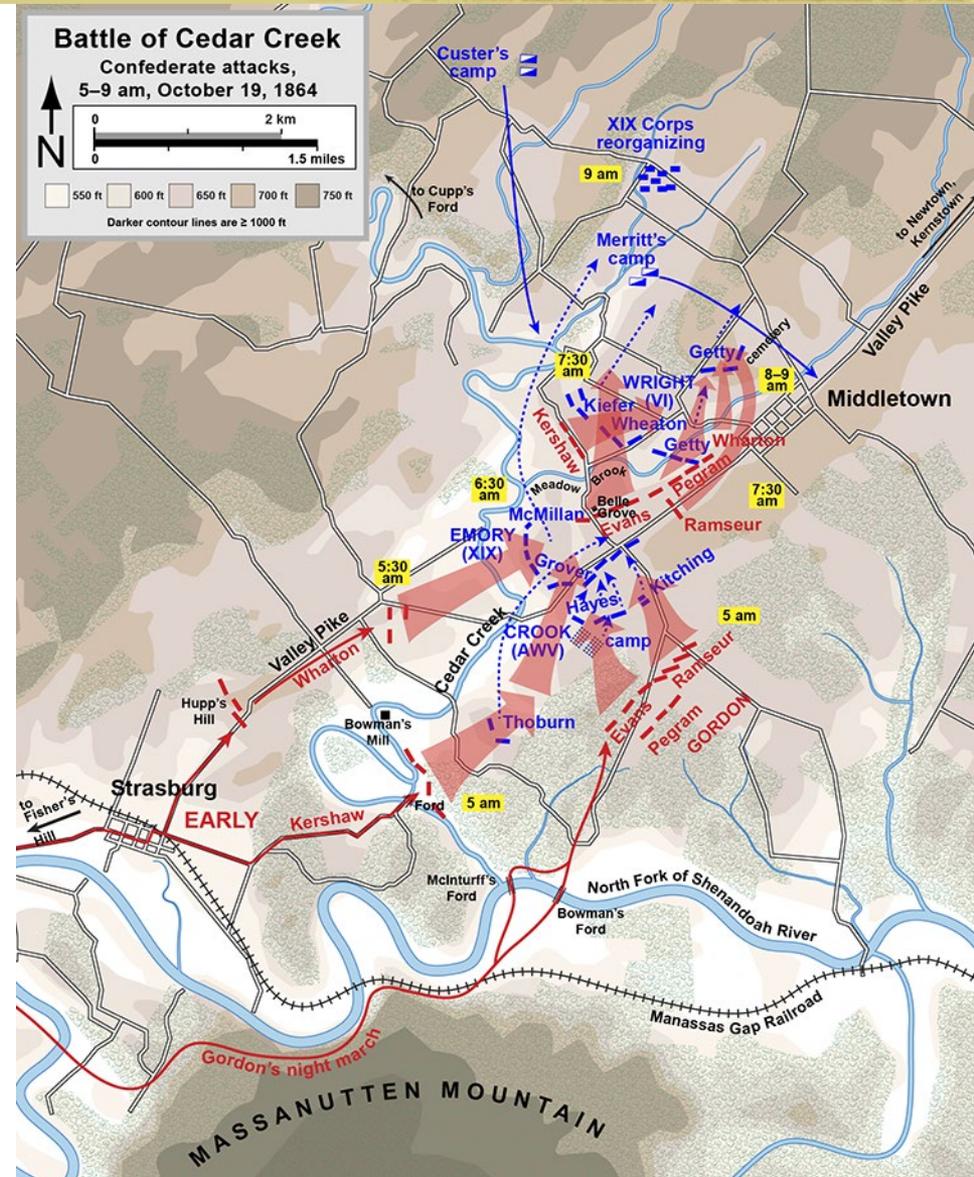

- Probably my first Wikipedia map (2005-ish)
- Emphasizing simplicity, but graphically crude
- Macromedia Freehand

Battle of Cedar Creek

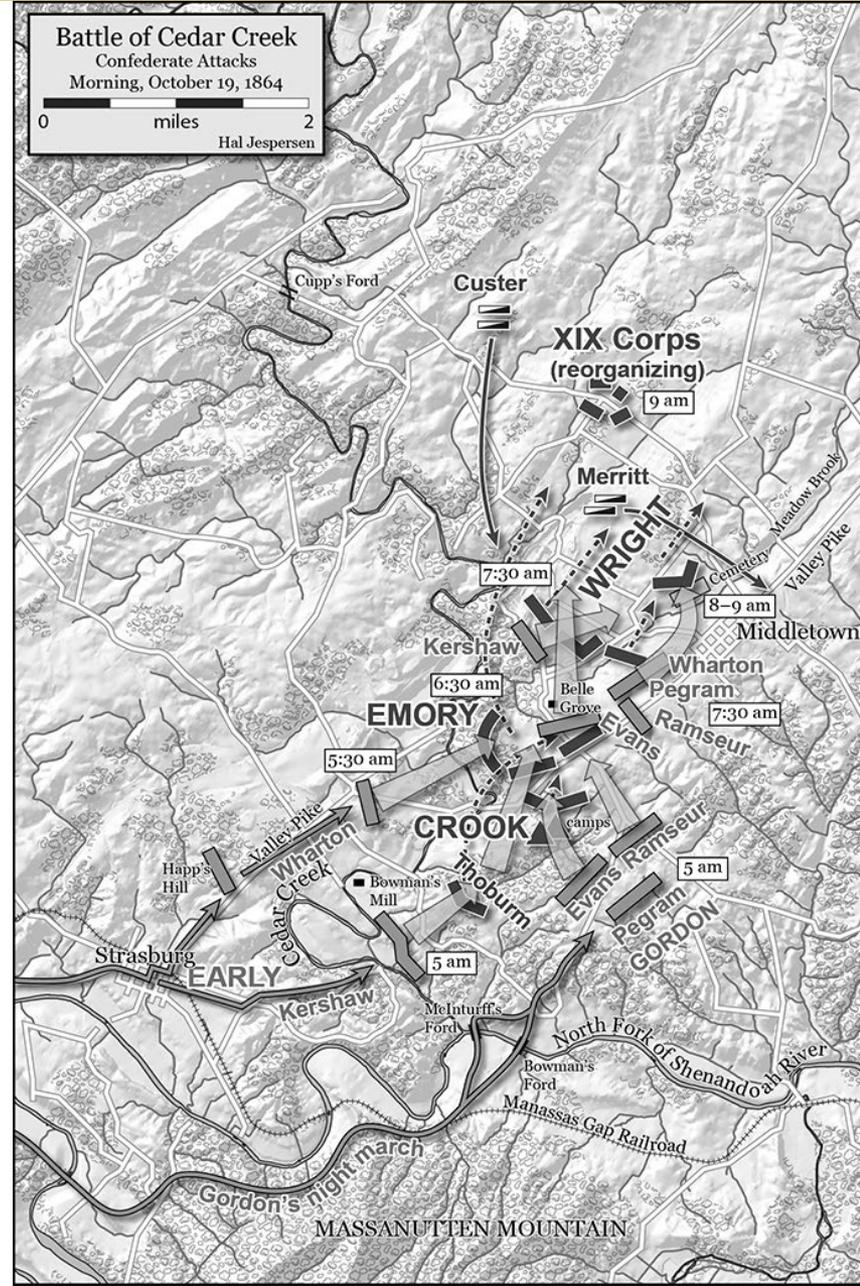

Later Version

- Replaced in Wikipedia in 2011
- More accurate terrain and features
- More battle detail
- But ... a style impractical for most books

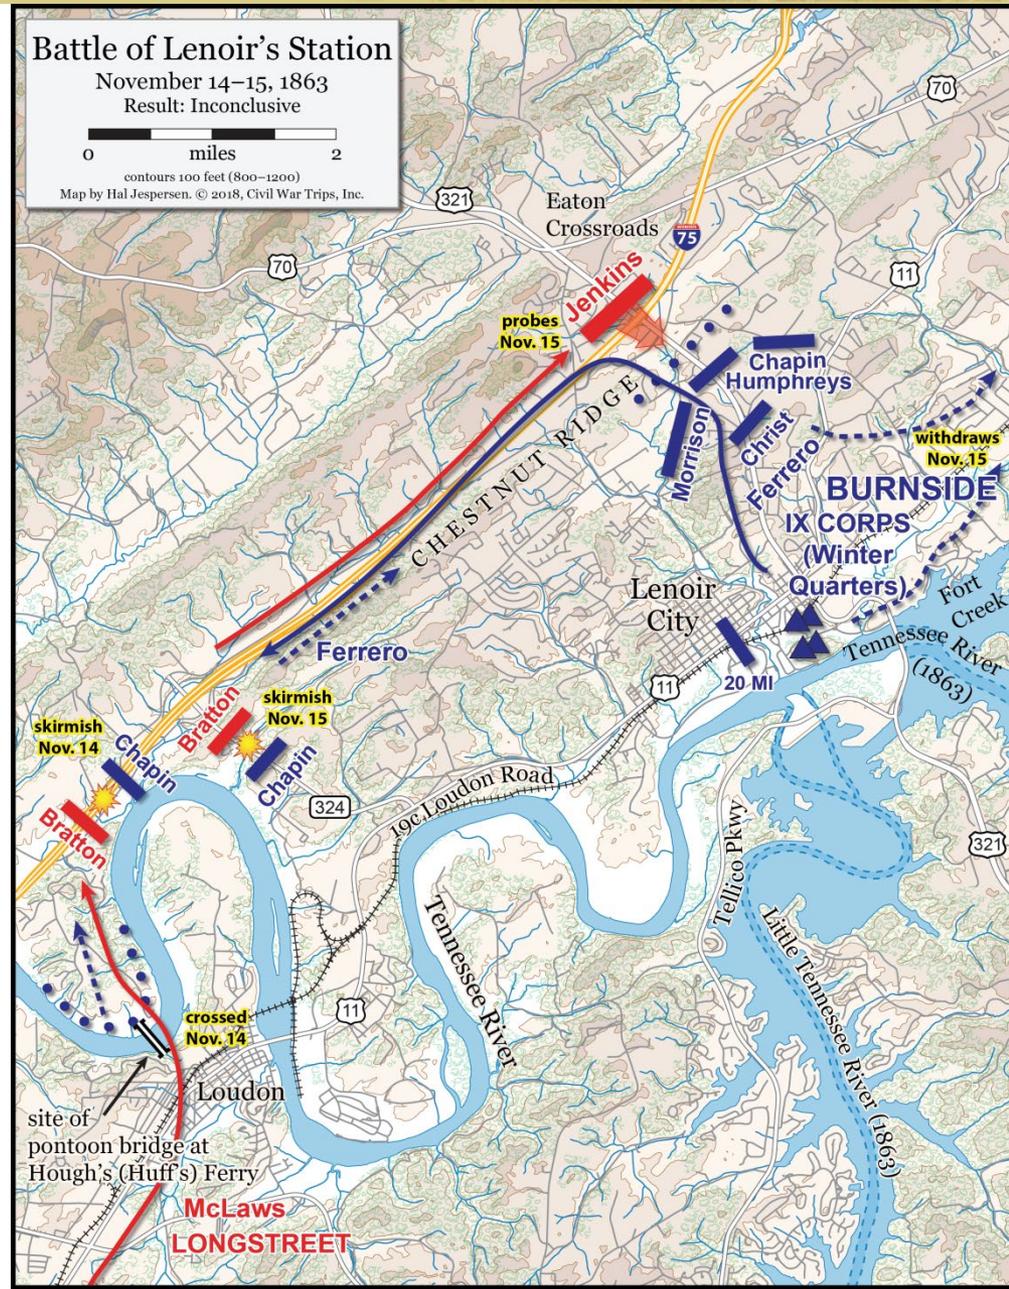

Book Version

- Shaded relief elevation
- Different feature styles for grayscale publication
- Not a successful map, although the authors were happy

Better Data Sources

- Instead of tracing old maps ...
- Use government data to show accurate
 - Terrain elevation
 - Watercourses
 - Modern road and rail networks

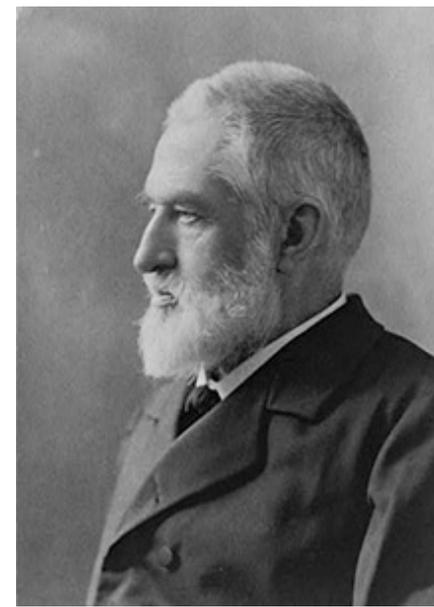

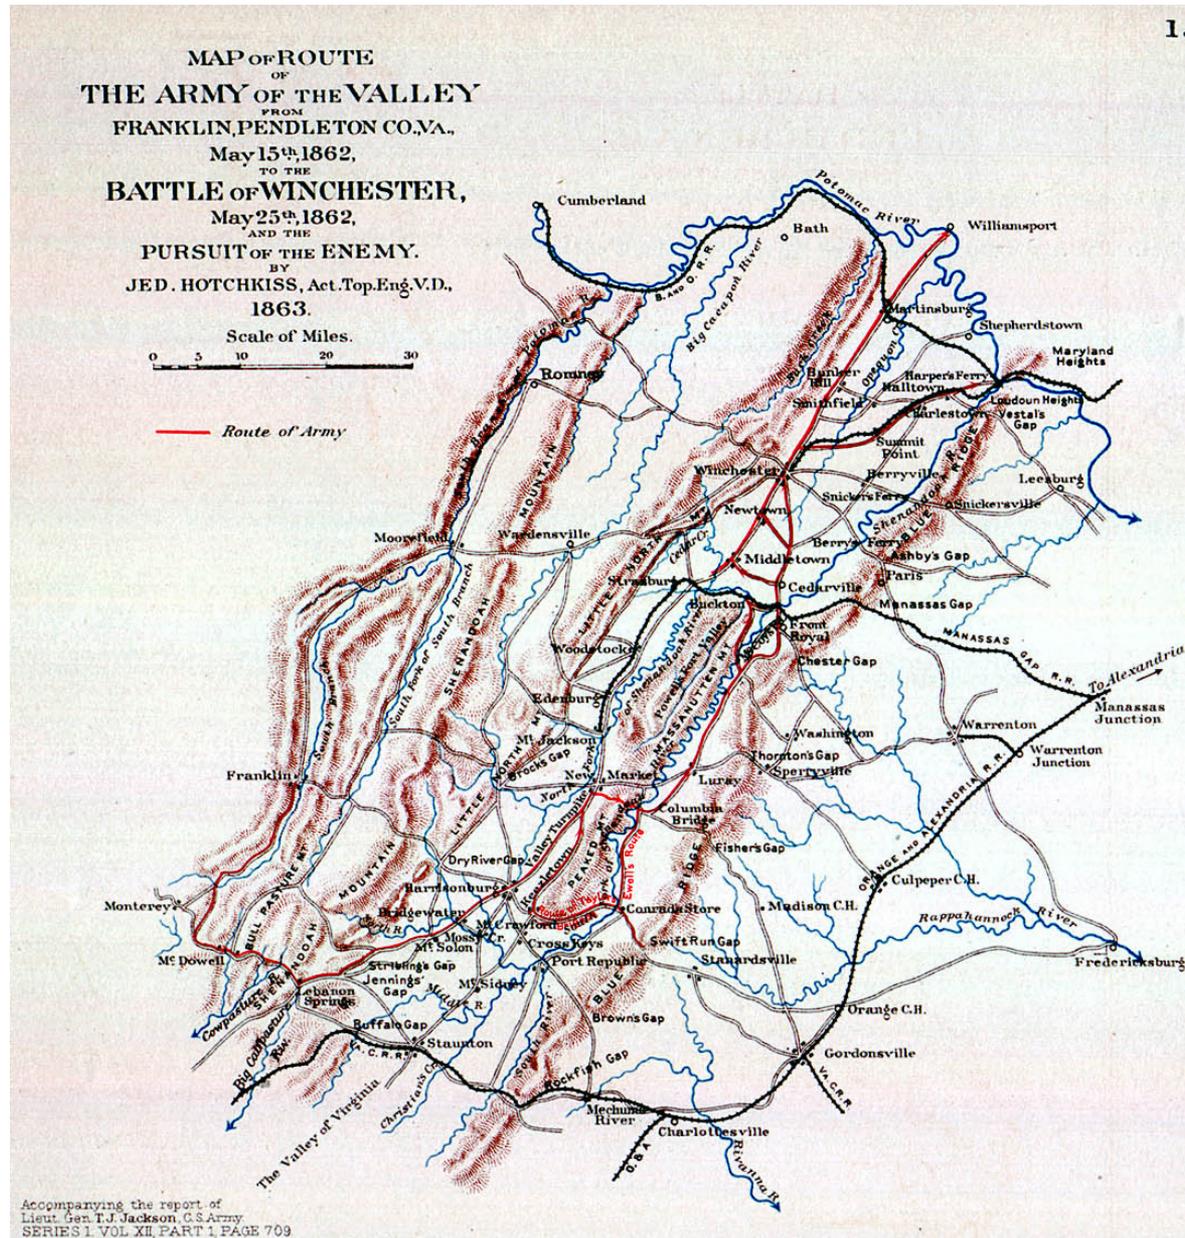

Outline

- My history in mapmaking
- **Famous cartographers who influenced me**
- How I work with authors
 - Determining content
 - Publication challenges and issues
- Mapmaking tools and workflow
- Technical aspects of cartography: projection, elevation, data sources
- Accuracy of 19c maps

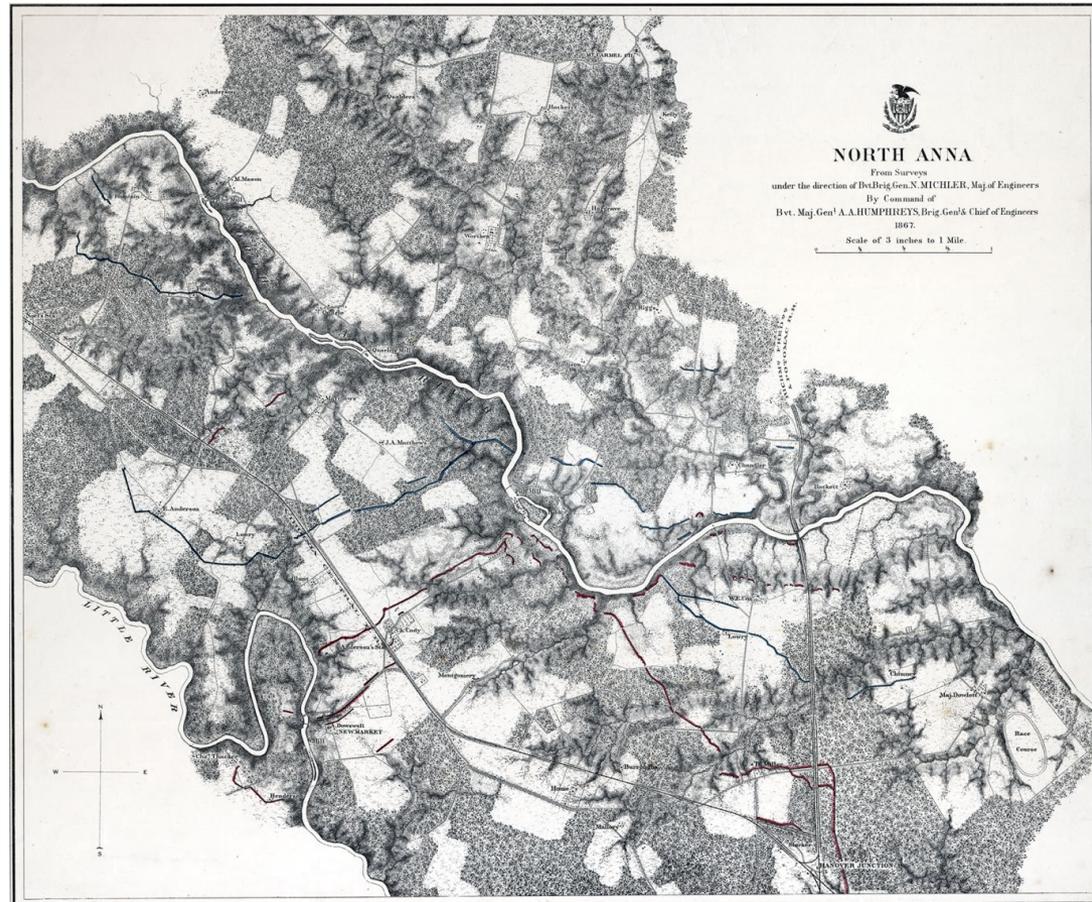

“Major” Jedediah Hotchkiss, CSA

1.

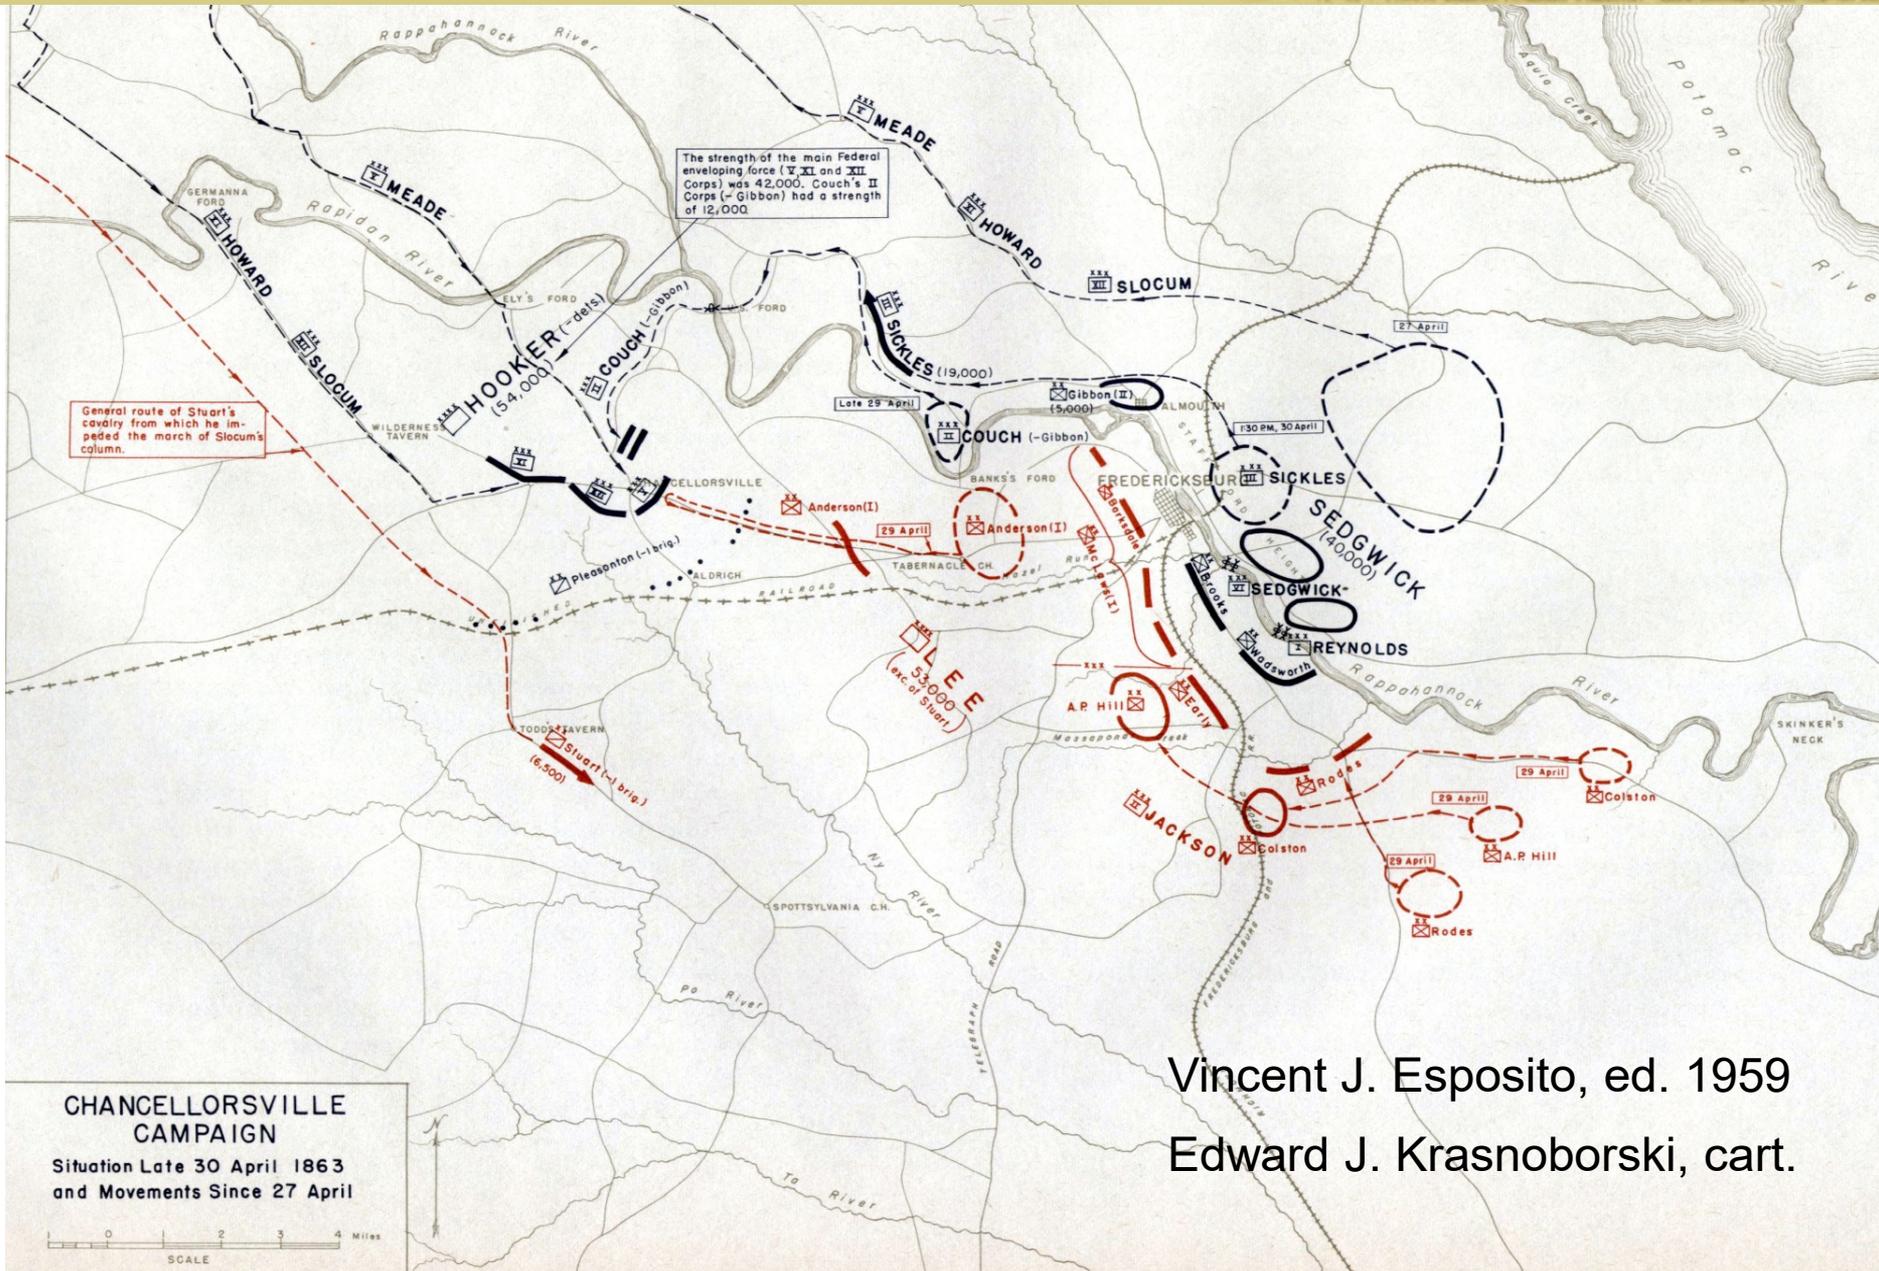

Nathaniel Michler

- Major, Army of the Potomac
- Collaborated with Capt. Peter Michie
- Most accurate battlefield maps

1867 map of North Anna battlefield

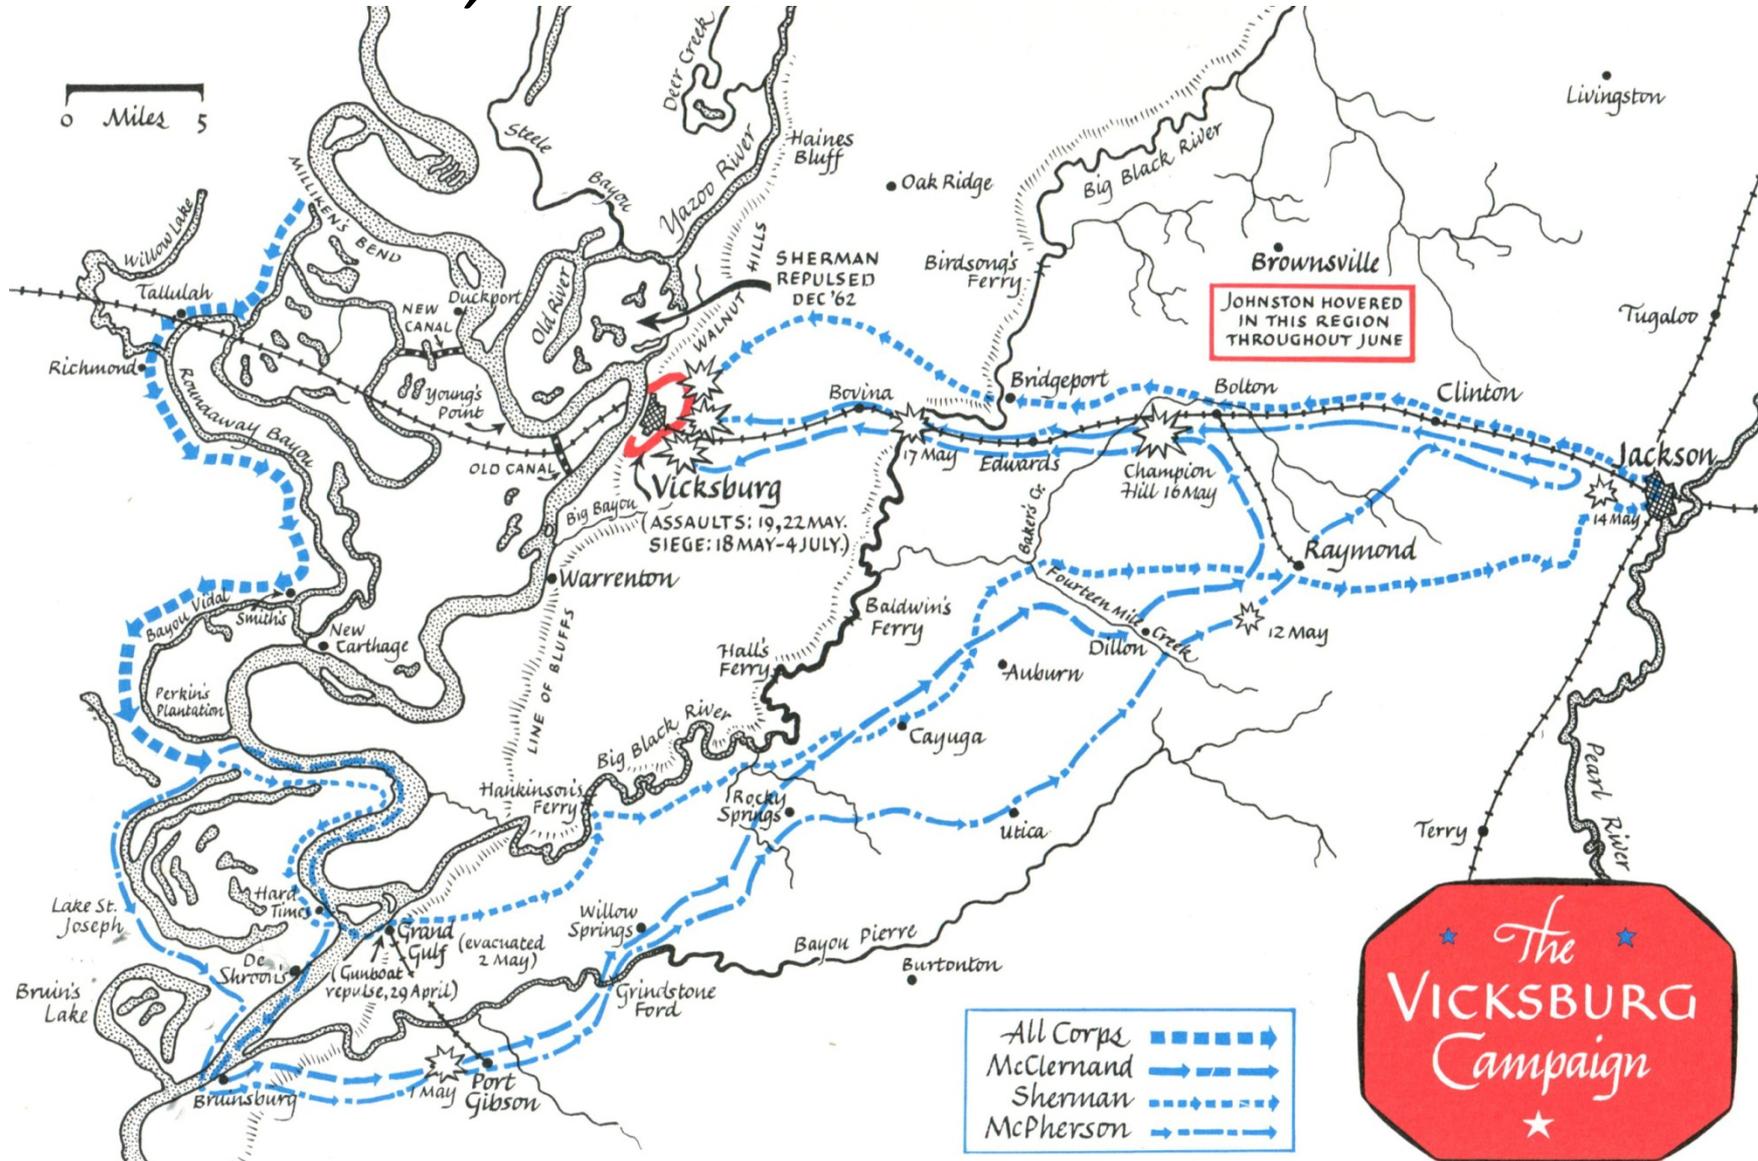

West Point Atlas of American Wars

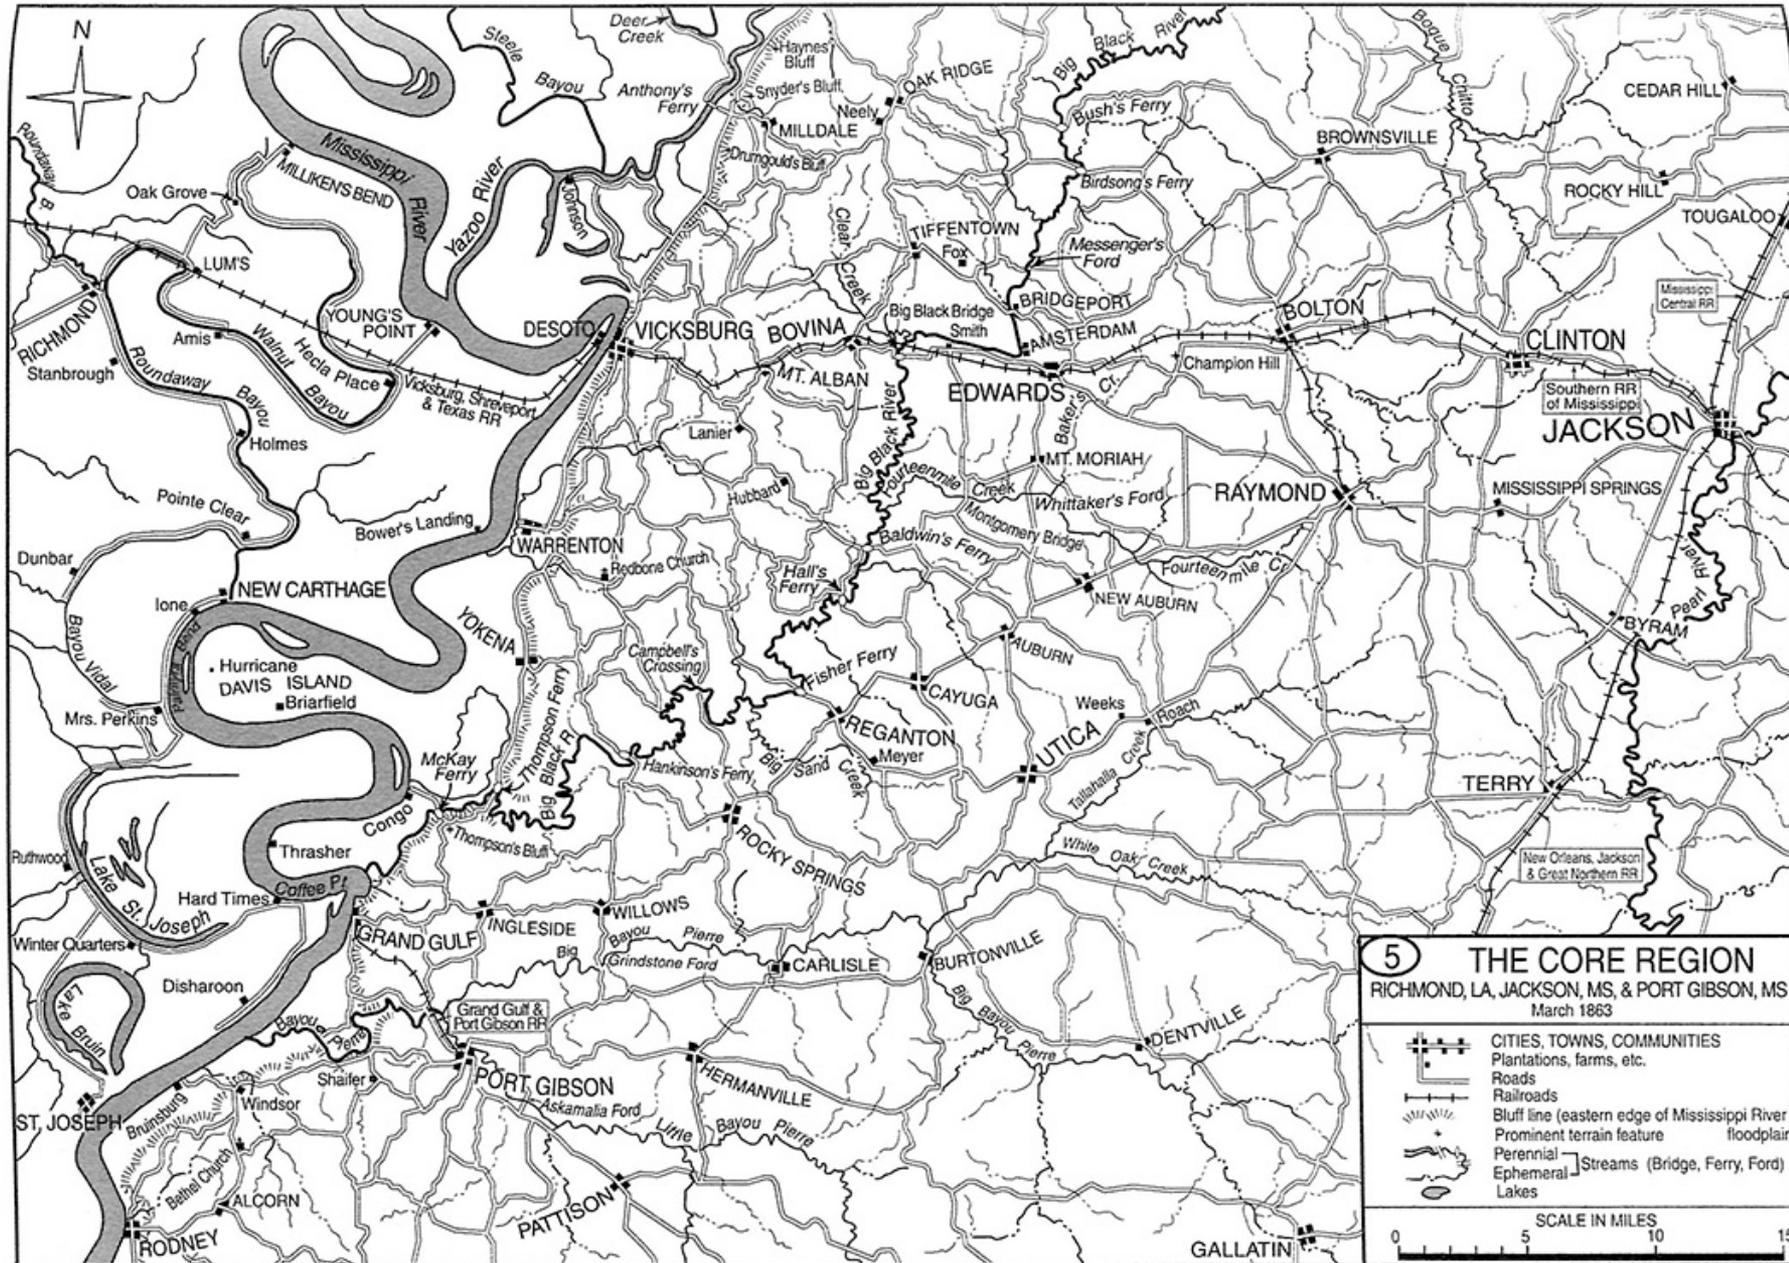

Vincent J. Esposito, ed. 1959
Edward J. Krasnoborski, cart.

George Annand, Shelby Foote

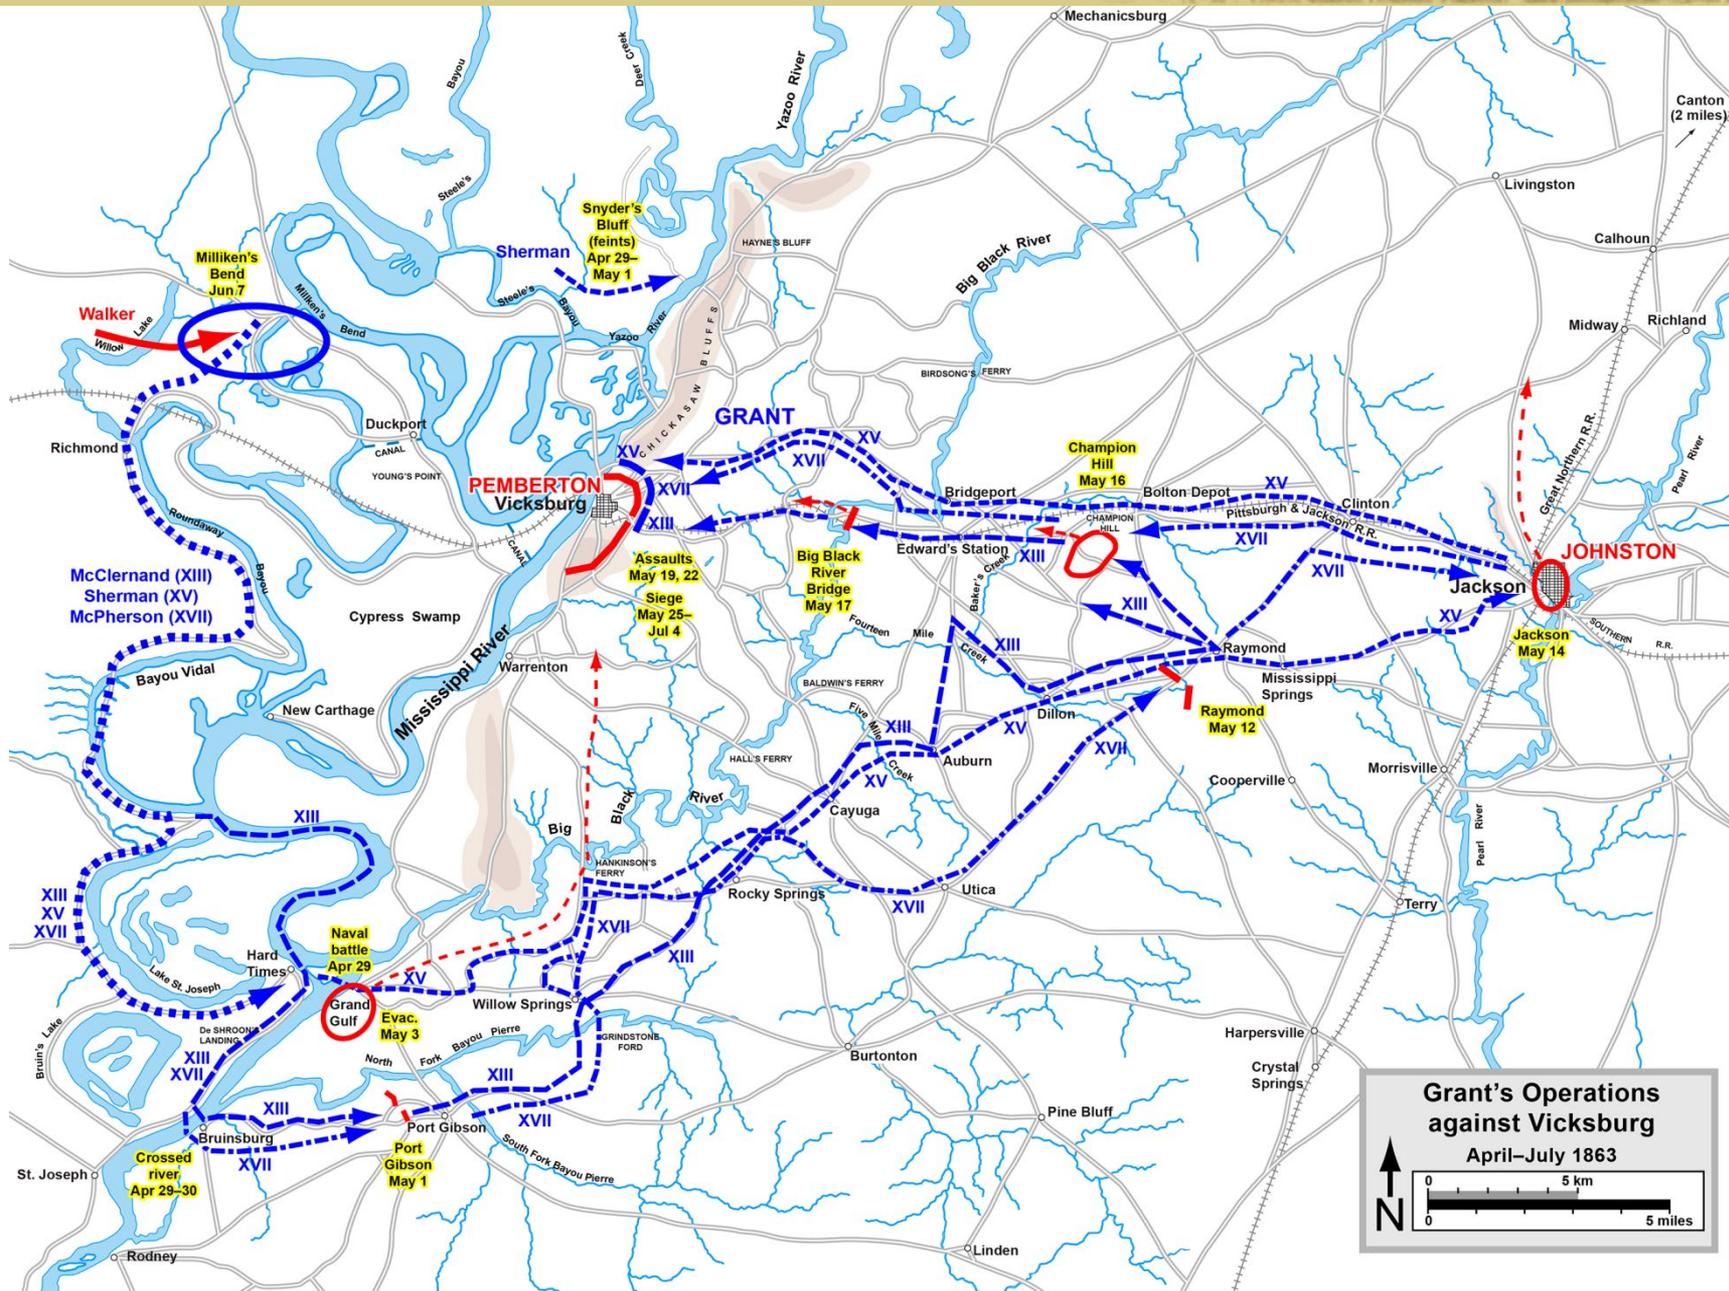

- *The Civil War, a Narrative*

Warren Grabau – *Ninety-Nine Days*

My Vicksburg Campaign Map

David Greenspan

- *American Heritage Pictorial History of the Civil War*

Outline

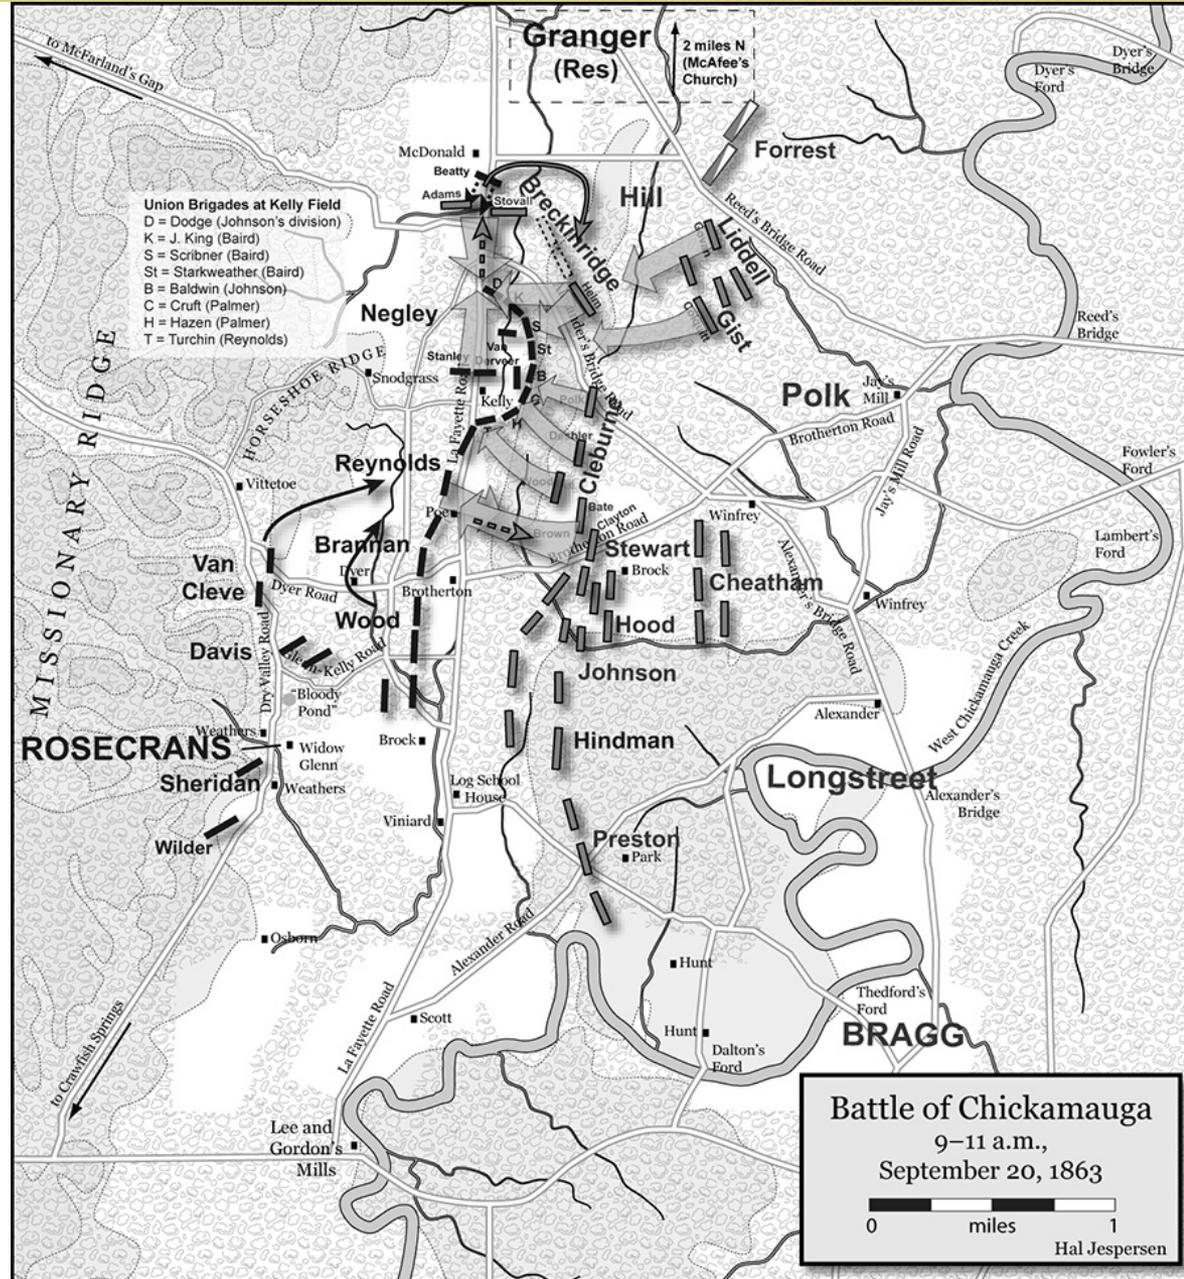

- My history in mapmaking
- Famous cartographers who influenced me
- **How I work with authors**
 - Determining content
 - Publication challenges and issues
- Mapmaking tools and workflow
- Technical aspects of cartography: projection, elevation, data sources
- Accuracy of 19c maps

Working with Clients

- Vast majority of my work comes from referrals: free Wikipedia maps, previous work for publishers
- Over 180 clients/projects so far
- Four ways they can provide me input ...

Types of Input, I

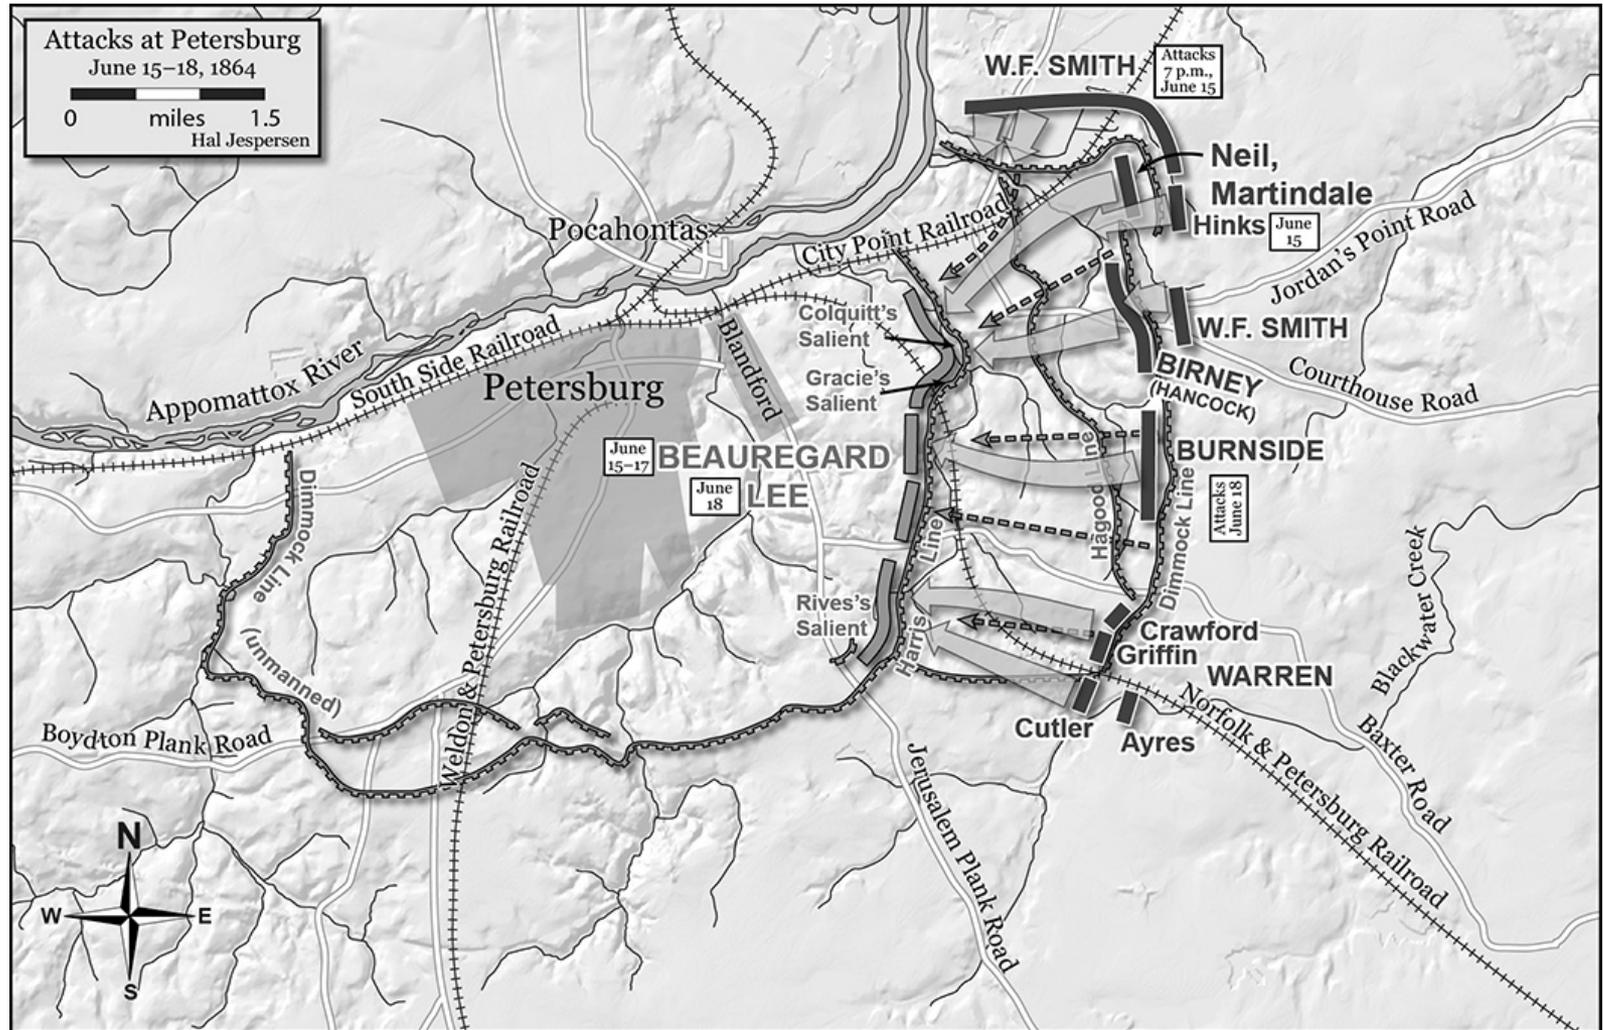

- Convert free Wikipedia map

Frank Varney, *General Grant and the Rewriting of History*

Types of Input, II

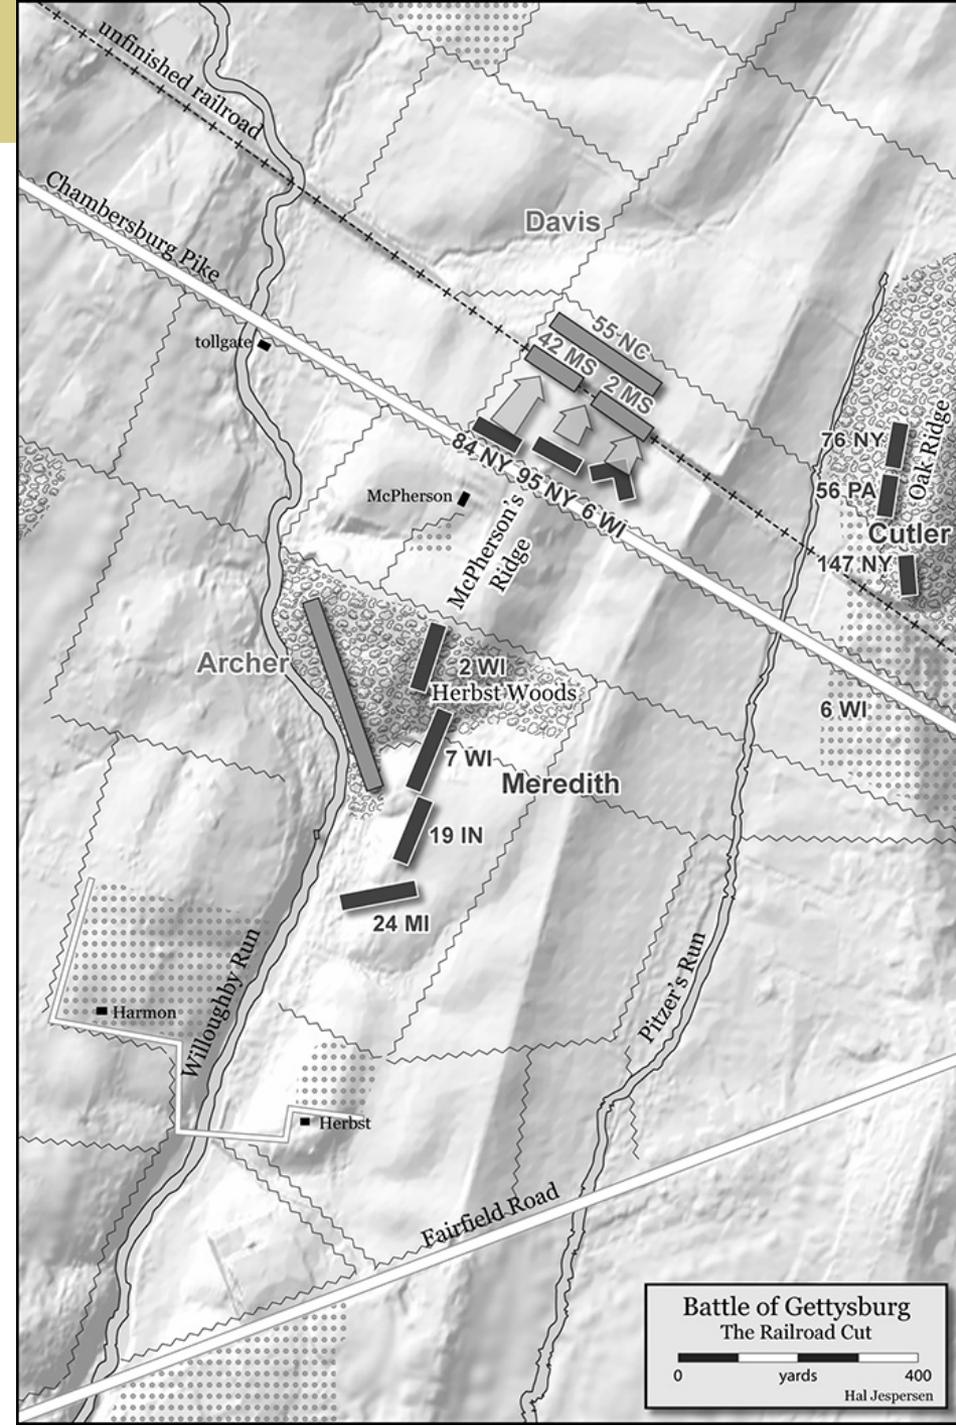

- Well-known battle or campaign

For history of 62nd Pennsylvania, by Ernie Spisak

Types of Input, III

- Less well-known, but published maps exist

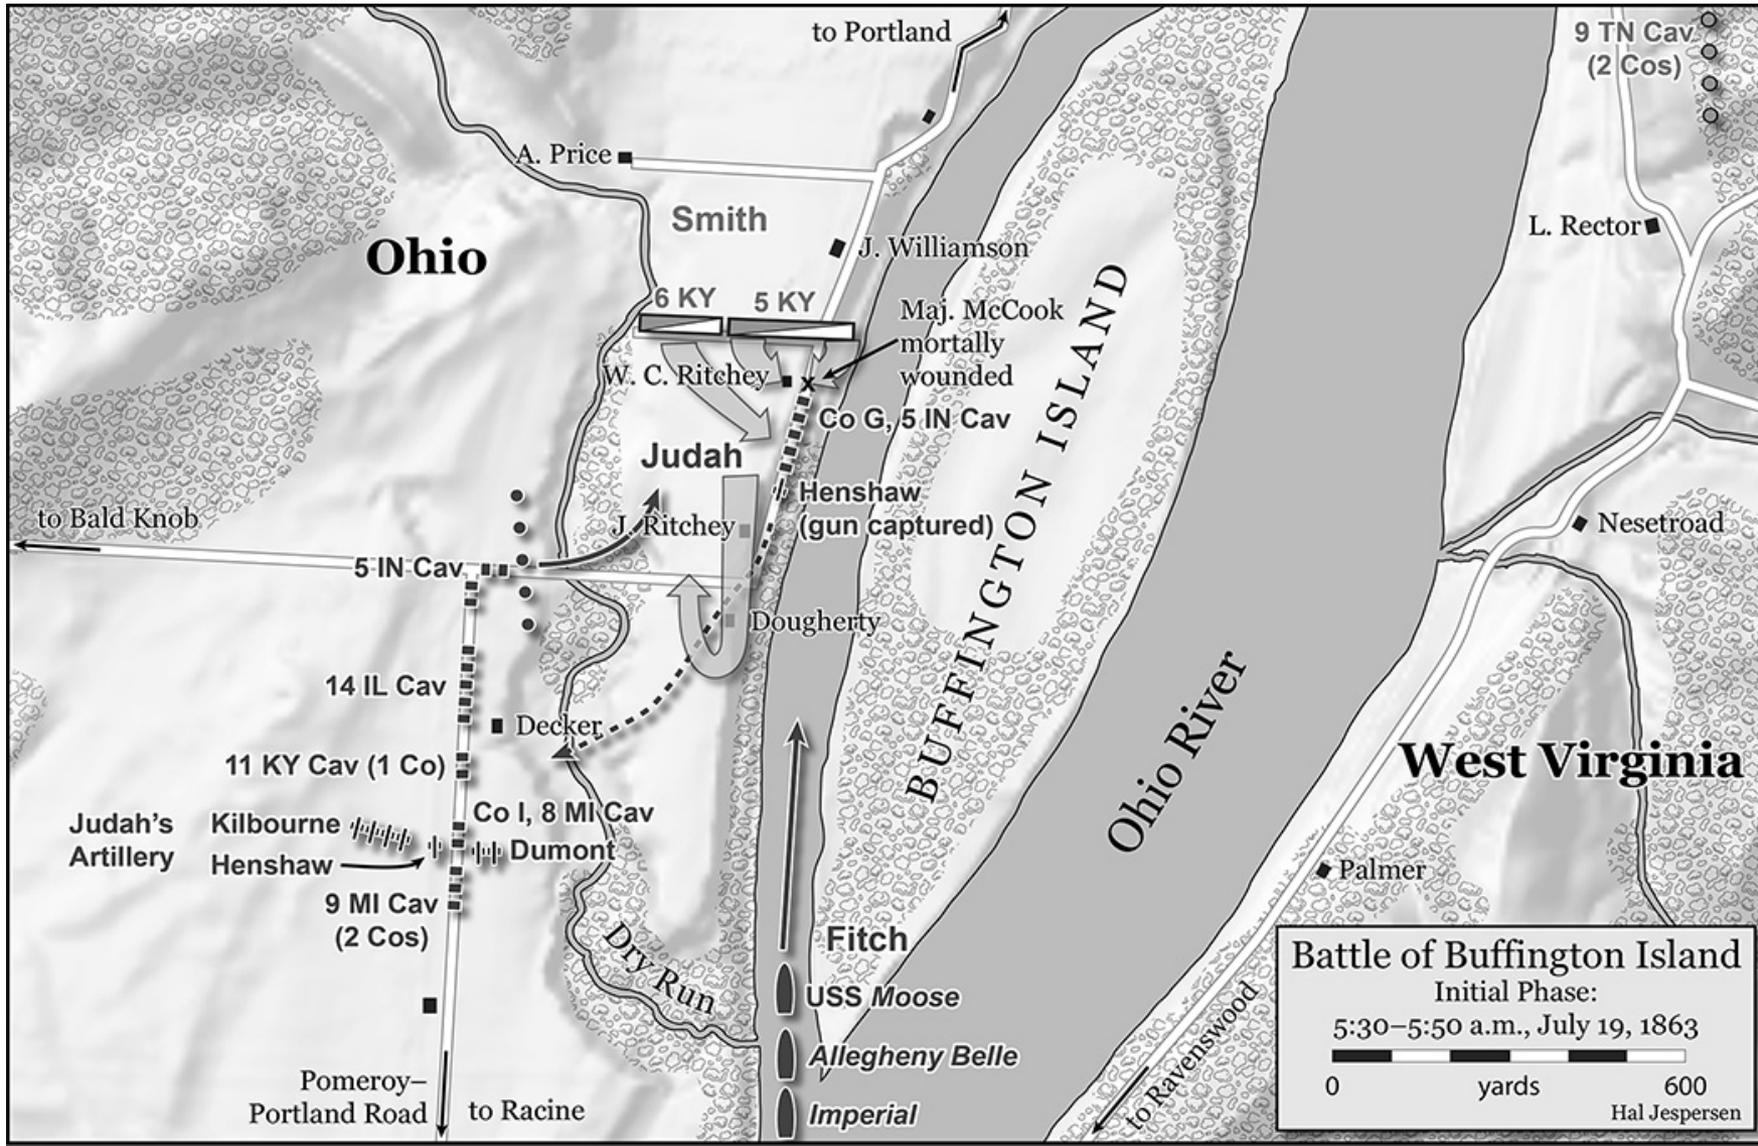

Lance Herdegen, *The Iron Brigade in Civil War and Memory*

Types of Input, IV

- Author provides sketch map

David Mowery,
Morgan's Great Raid

Publication Challenges

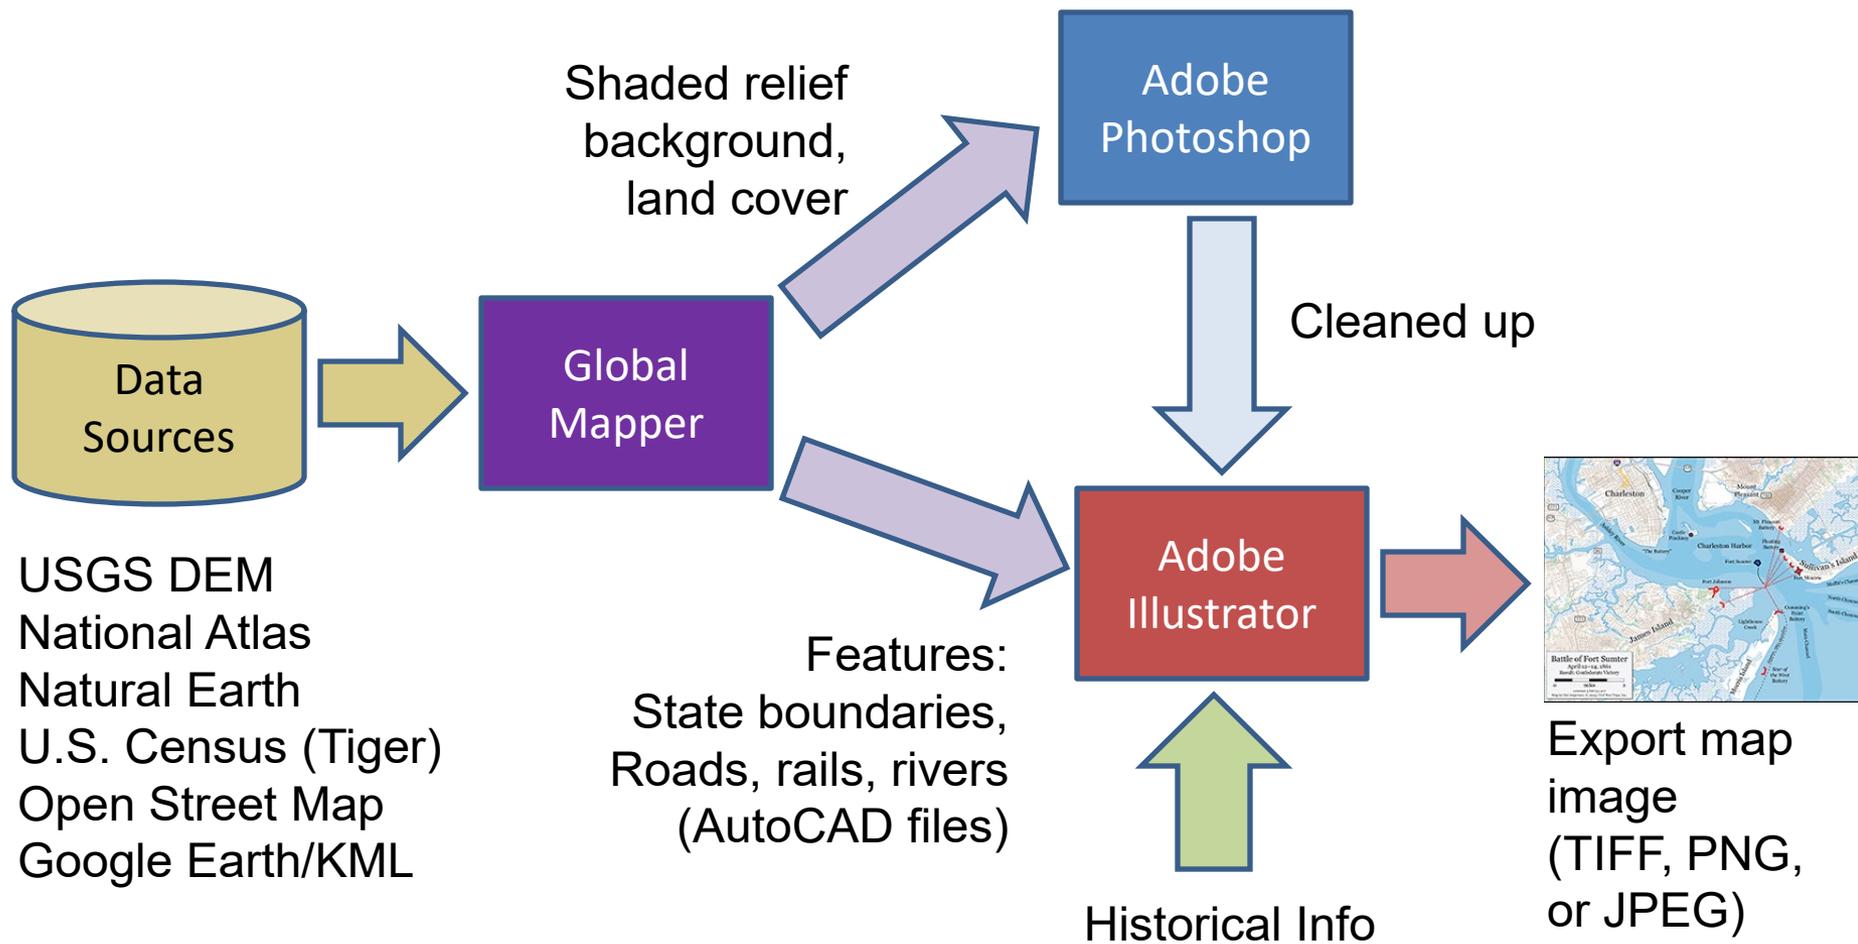

- Grayscale more challenging than full color
- Small size
 - Typically 4.75 x 7 inches, one quarter the size of a Wikipedia map
 - Limited space for type; publishers frown on type smaller than 6 point
- Proof reading?

Outline

- My history in mapmaking
- Famous cartographers who influenced me
- How I work with authors
 - Determining content
 - Publication challenges and issues
- **Mapmaking tools and workflow**
- **Technical aspects of cartography: projection, elevation, data sources**
- Accuracy of 19c maps

My Cartography Workflow

Global Mapper – Blue Marble Geographics

The screenshot displays the Global Mapper v15.2 software interface. The title bar reads "Global Mapper v15.2 (b052114) [64-bit] - REGISTERED (Mine Run Campaign workspace.gmw*)". The menu bar includes File, Edit, View, Tools, Analysis, Search, GPS, and Help. The toolbar contains various icons for file operations, navigation, and analysis. A dropdown menu shows "Daylight Shader" and a button for "*Generate Contours From Elevation Data".

The main map area shows a topographic map with a grid overlay. A red line represents a road, and a blue area represents a reservoir. The map is overlaid with a grid of 300, 400, 500, 600, and 700-foot contours. The grid is labeled "grdn39w078_13 GRID (w001001.adf)".

An "Overlay Control Center" window is open, showing a list of currently opened overlays. The list includes:

- World Topo Map Direct
- grdn39w078_13 GRID (w001001.adf)
- 300 (257 Features)
- 400 (269 Features)
- 500 (92 Features)
- 600 (10 Features)
- 700 (8 Features)
- Culpeper Co., VA (TL_2013_51047_EDGES.SHP) [21,627 Feat.
- Orange Co., VA (TL_2013_51137_EDGES.SHP) [14,459 Featur
- Spotsylvania Co., VA (TL_2013_51177_EDGES.SHP) [34,997 F
- Stafford Co., VA (TL_2013_51179_EDGES.SHP) [18,552 Featur
- Fauquier Co., VA (TL_2013_51061_EDGES.SHP) [41,029 Featu
- _VA areawater.gmp
- CUNY Rivers 40-80.gmp
- GM Highways CONUS.gmp
- nlcd_2011_landcover_2011_edition_2014_03_31.img
- _Fords, bridges, and gaps.kml [59 Features]
- VA cities.kml [222 Features]
- User Created Features [1 Features]

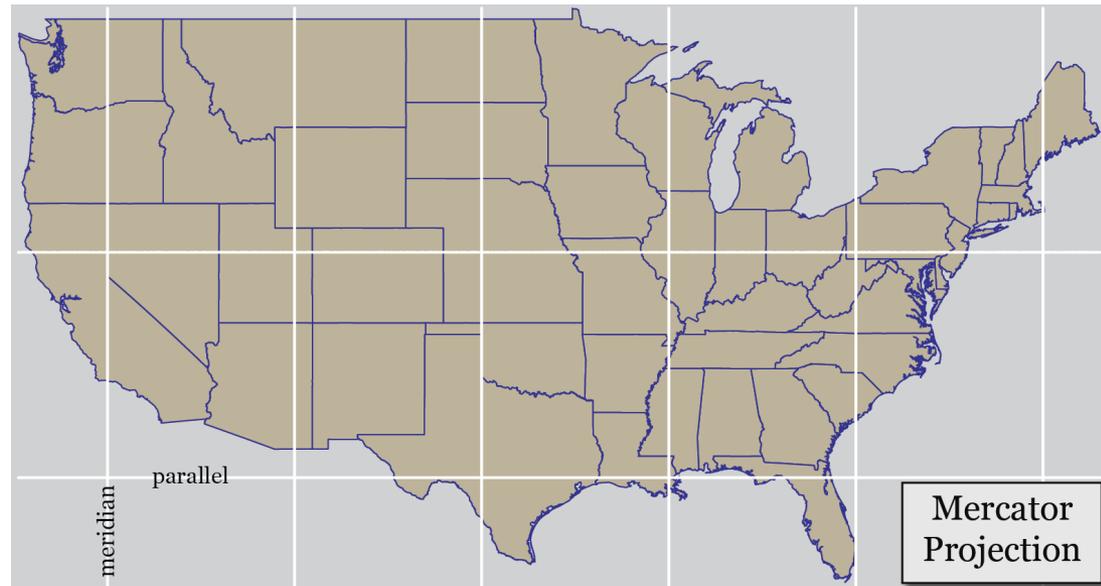

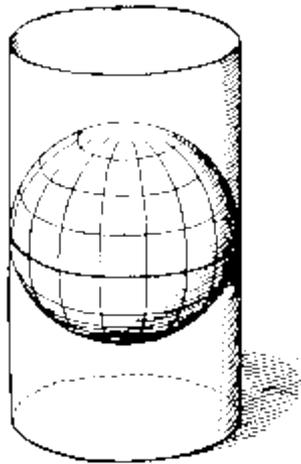

The status bar at the bottom shows the current location and scale: "<NO LABEL> Local Neighborhood Road, Street [Residential Road] - (Height = 426.6 ft - grdn39w078_13 GRID (w001001.adf)) | 1:100300 | MERCAT (WGS84) - (-8663057.285, 4595426.886, 426.6 ft) | 38.30014059° N, 77.82156767° W".

Projection – Mercator

- How to portray a spherical area on a flat surface?
- Mercator used by most online maps
- Easy to calculate routes and distances between points, but areas increase as you move farther from the Equator

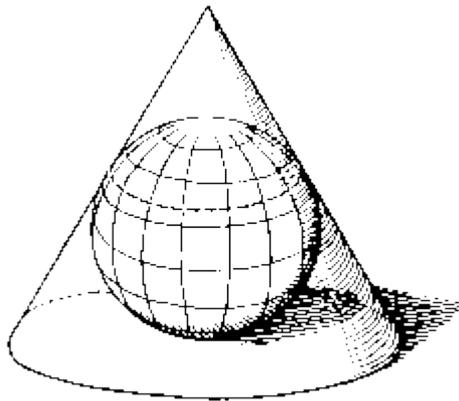

Gerardus Mercator, 1569

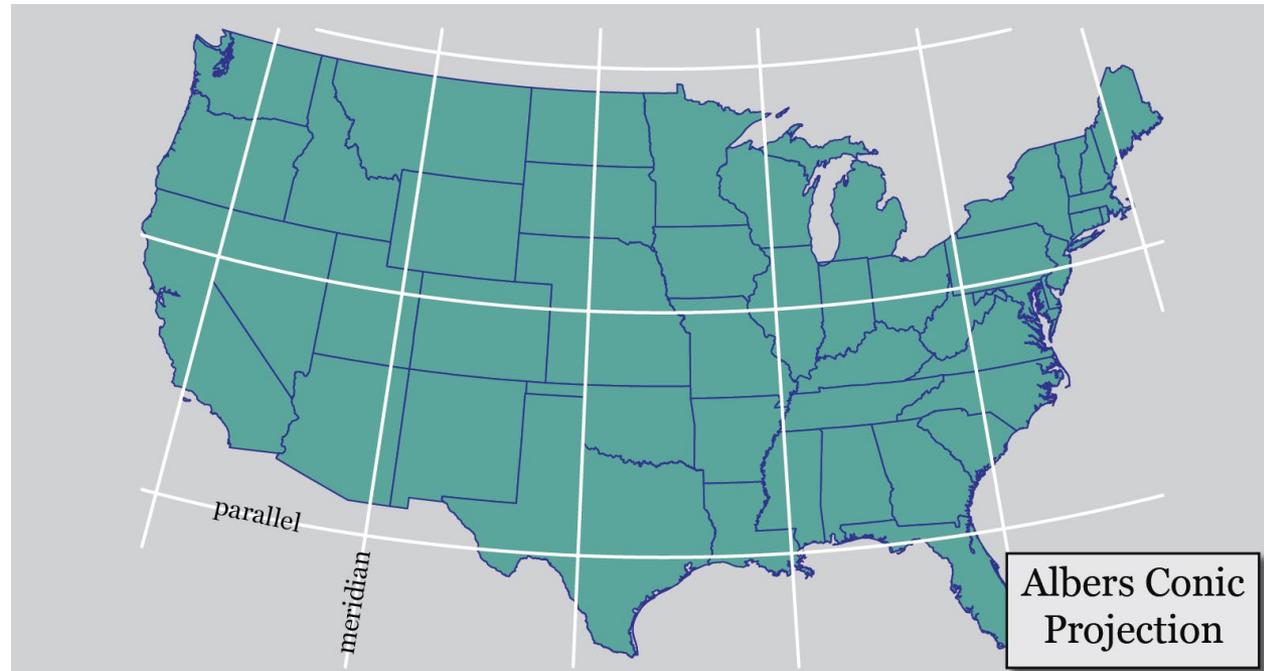

Projection – Albers Conic

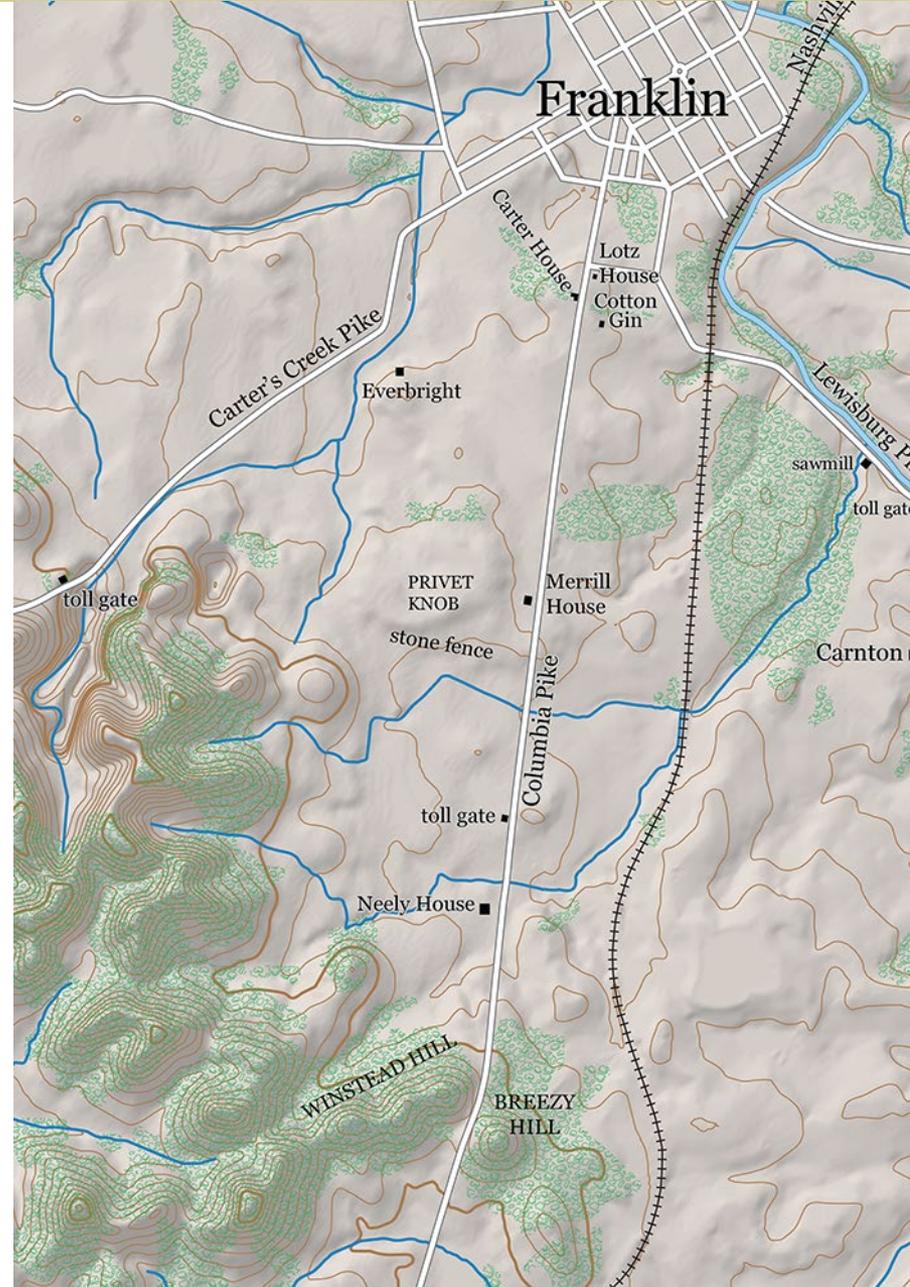

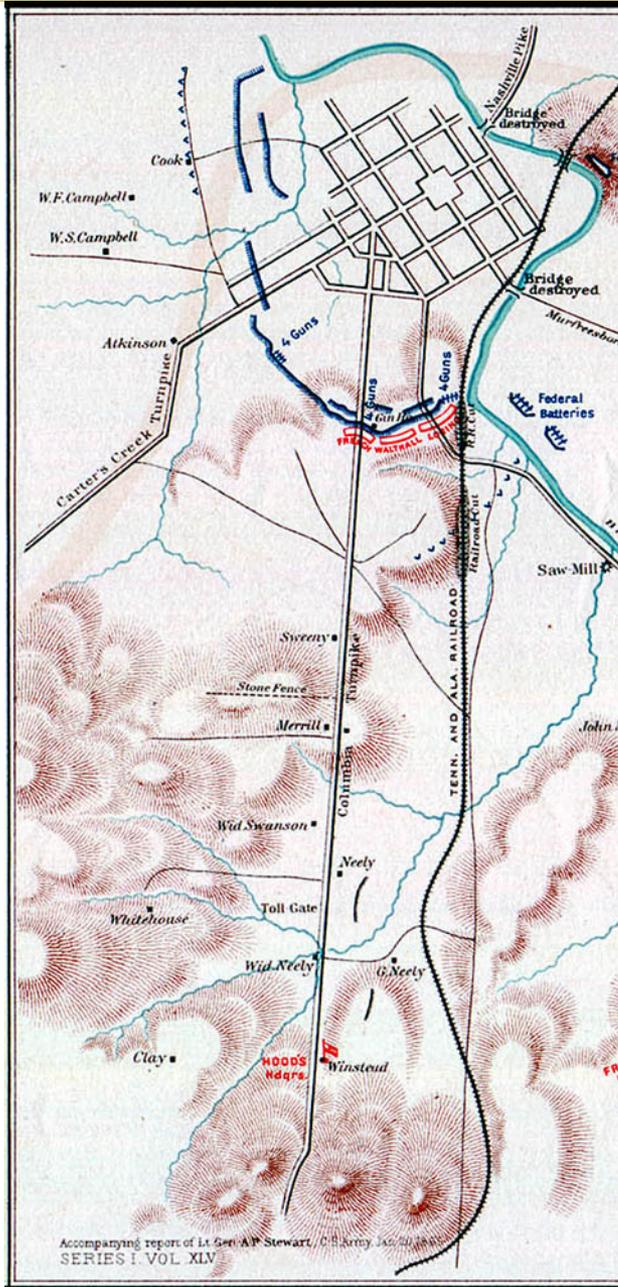

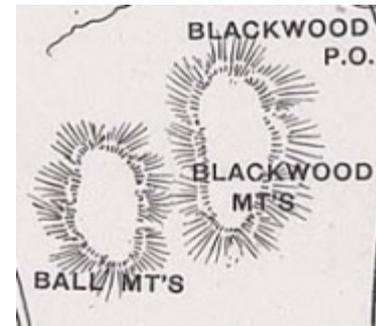

- Albers Conic Equal Area projection a more natural look for wide areas
- Areas equalized, but North not always straight up, and the East–West lines between points are curves

Heinrich Albers, 1805

Elevation: Hachures

OR Atlas,
plate 73/3

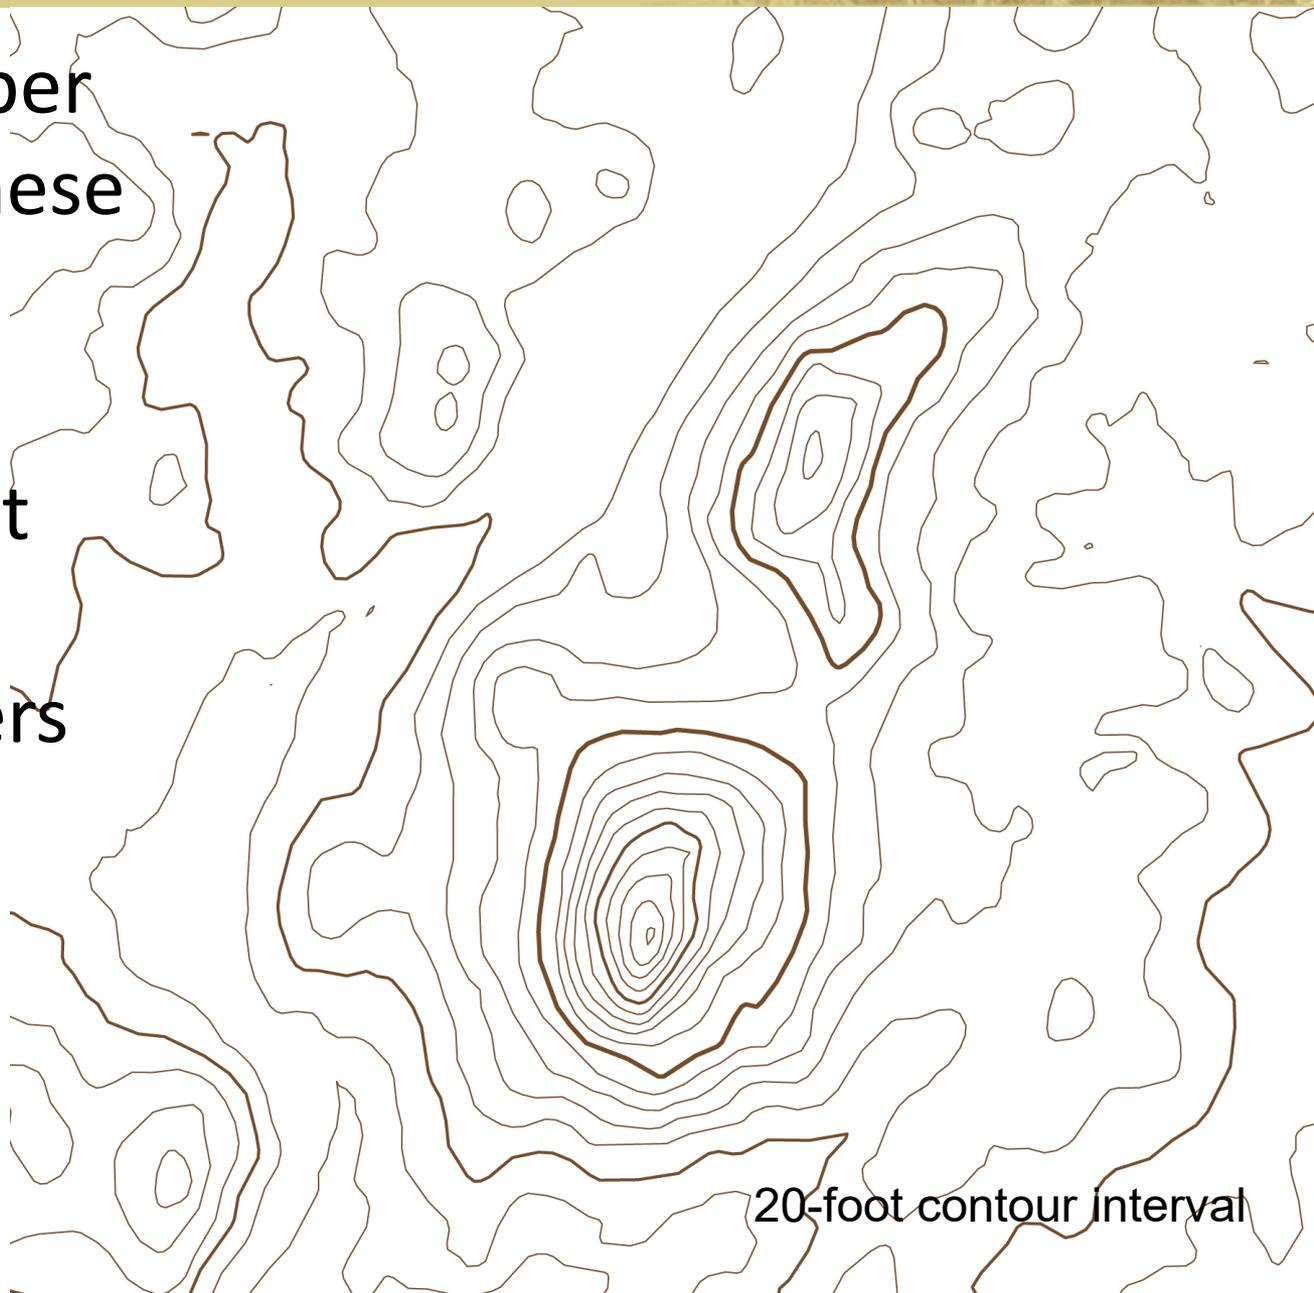

Elevation: Contour Lines

- Familiar format from USGS and military topographic maps

Elevation: Contour Lines, II

- Global Mapper generates these lines pretty easily
- Not the most intuitive for casual readers

20-foot contour interval

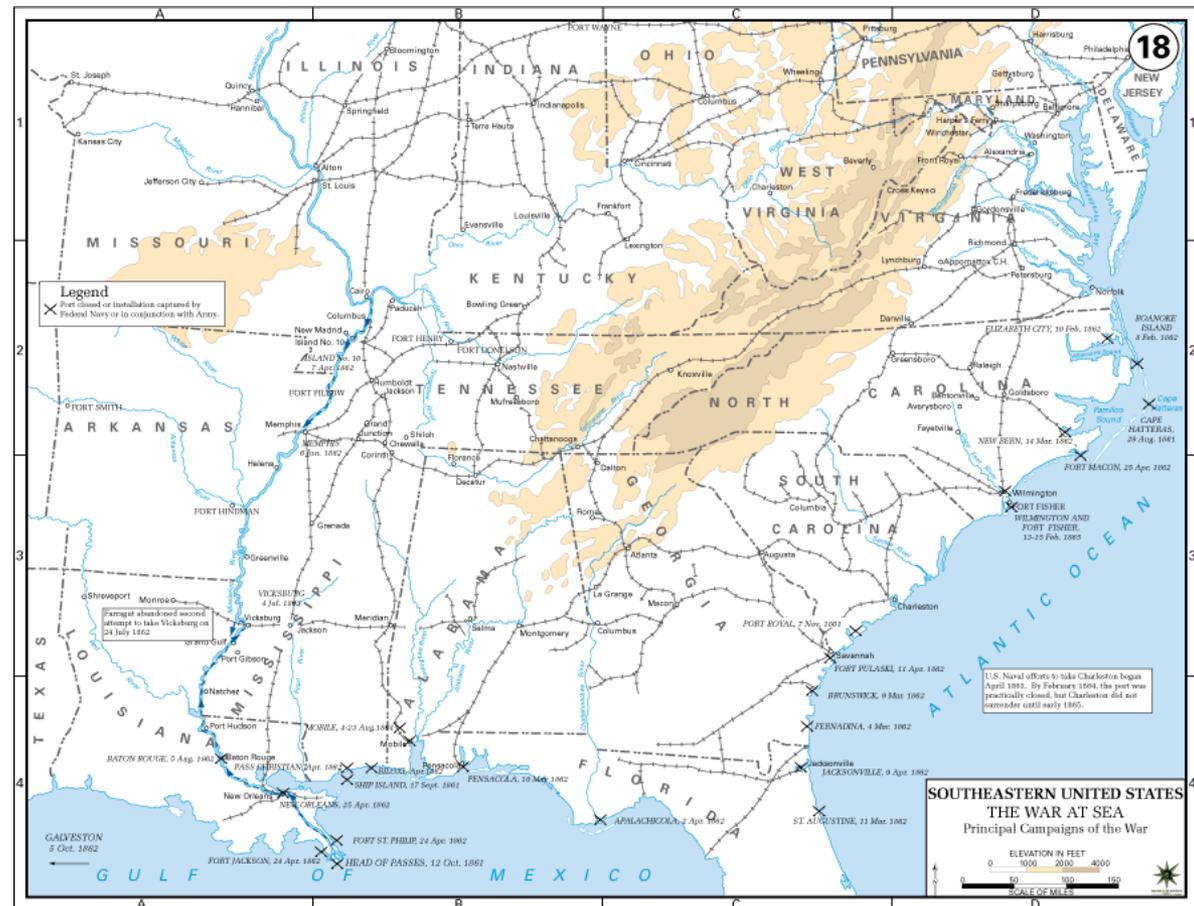

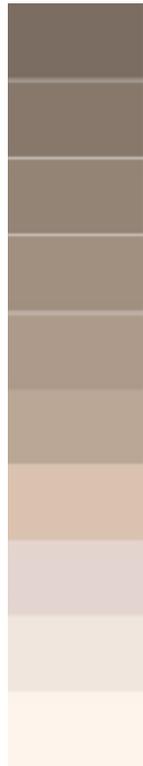

Elevation: Hypsometry

- Color shading indicates elevation
- Most-used color palette selected so that higher elevations look more “arid”

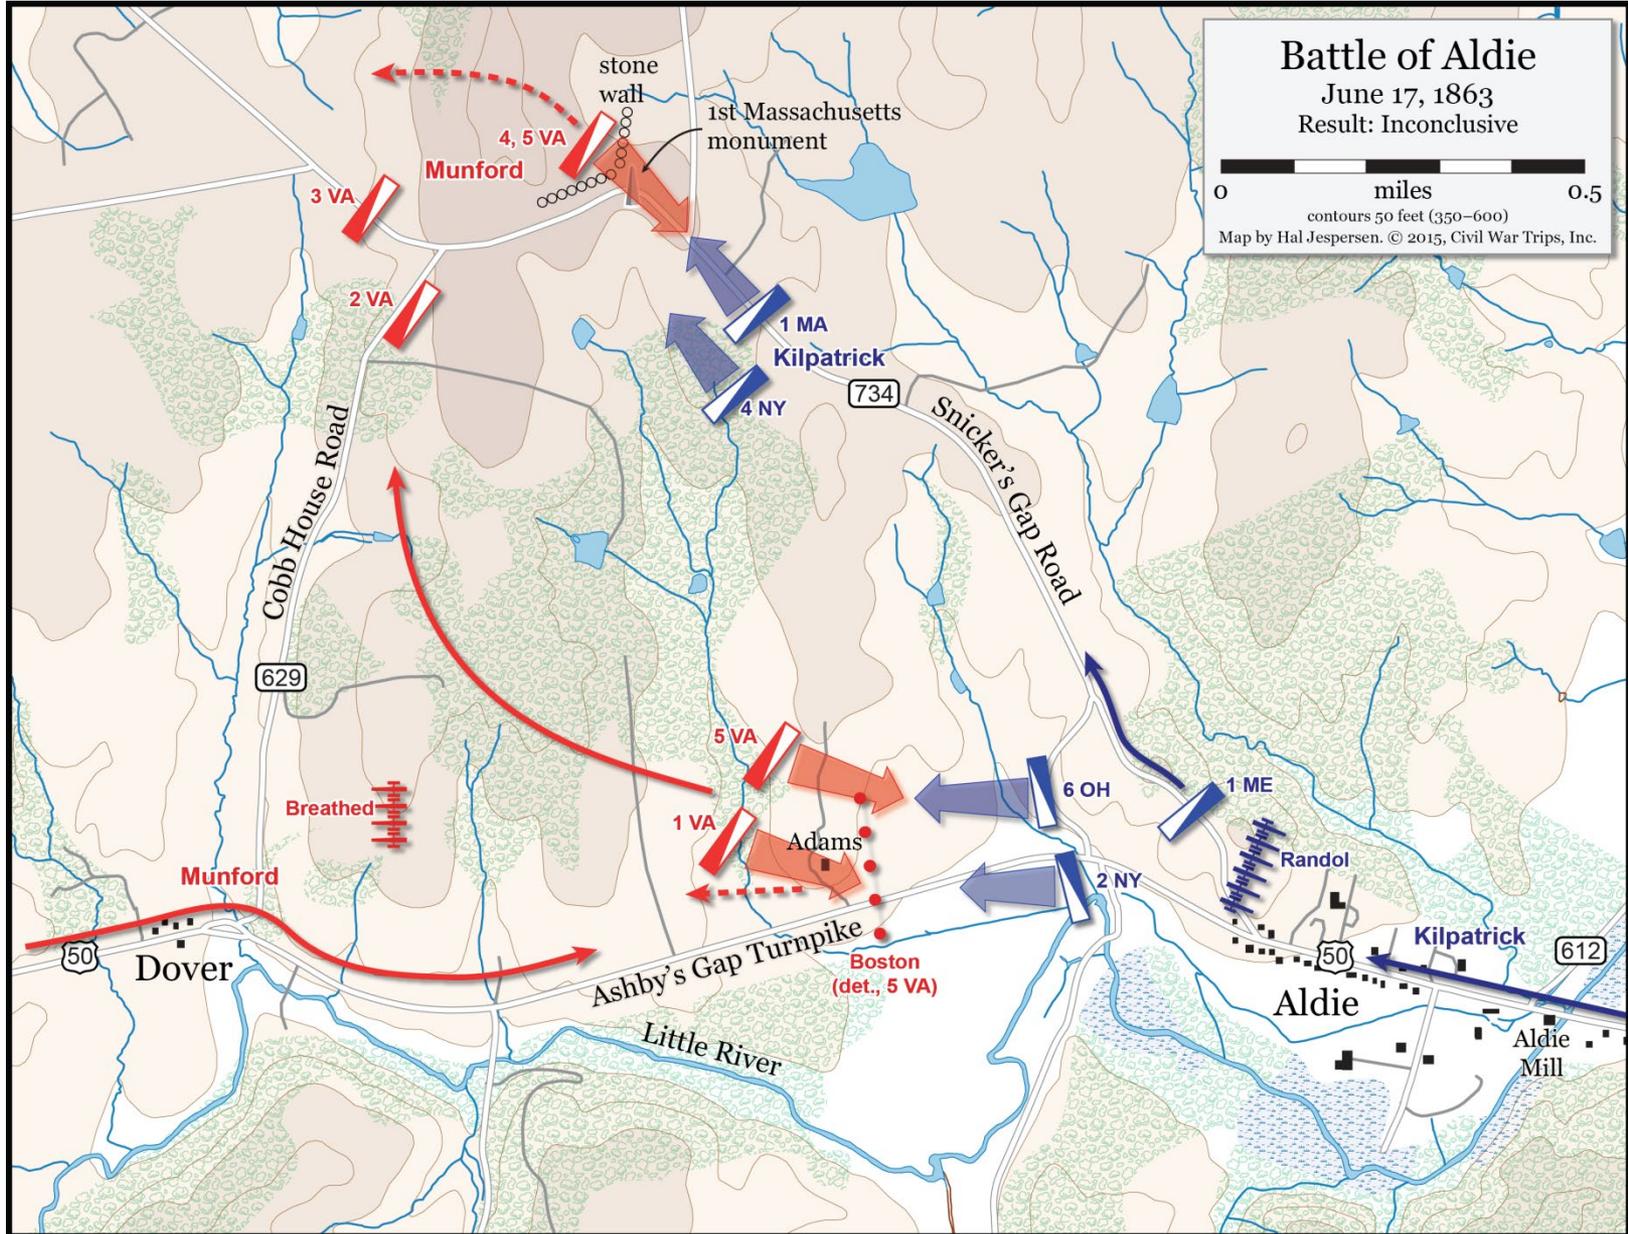

Elevation: Hypsometry, II

- My version of hypsometry is inspired by the later color editions of the *West Point Atlas*
- Colors areas defined by contour lines

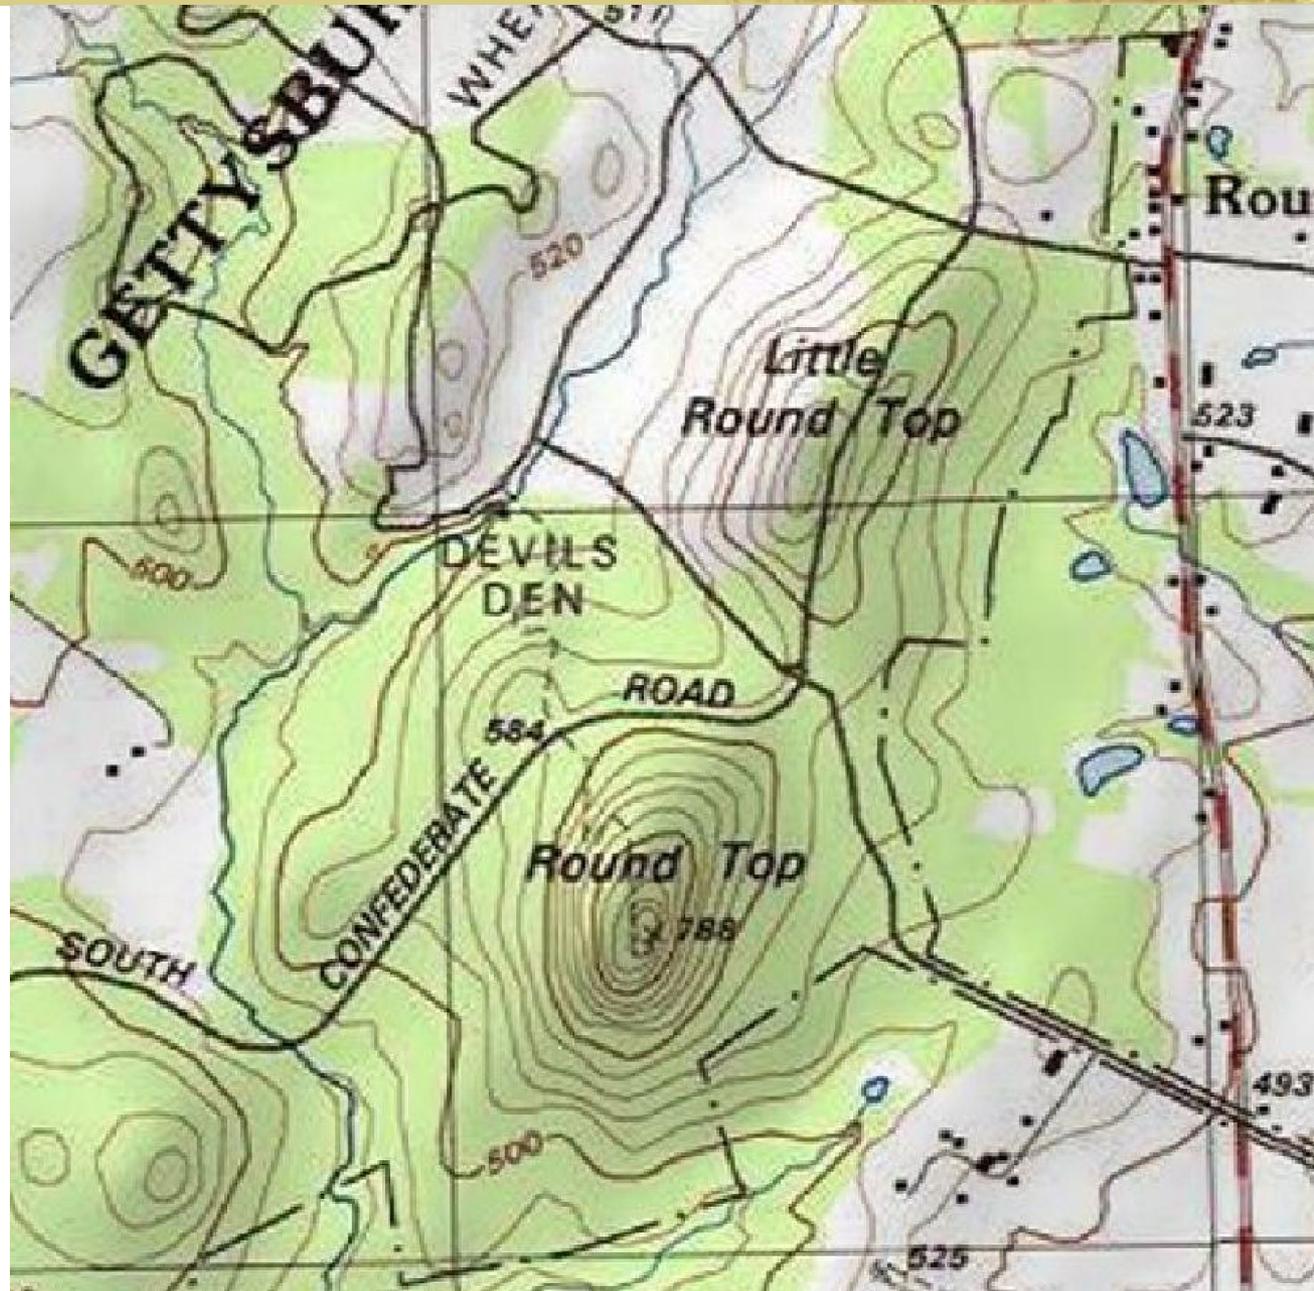

Elevation: Hypsometry, III

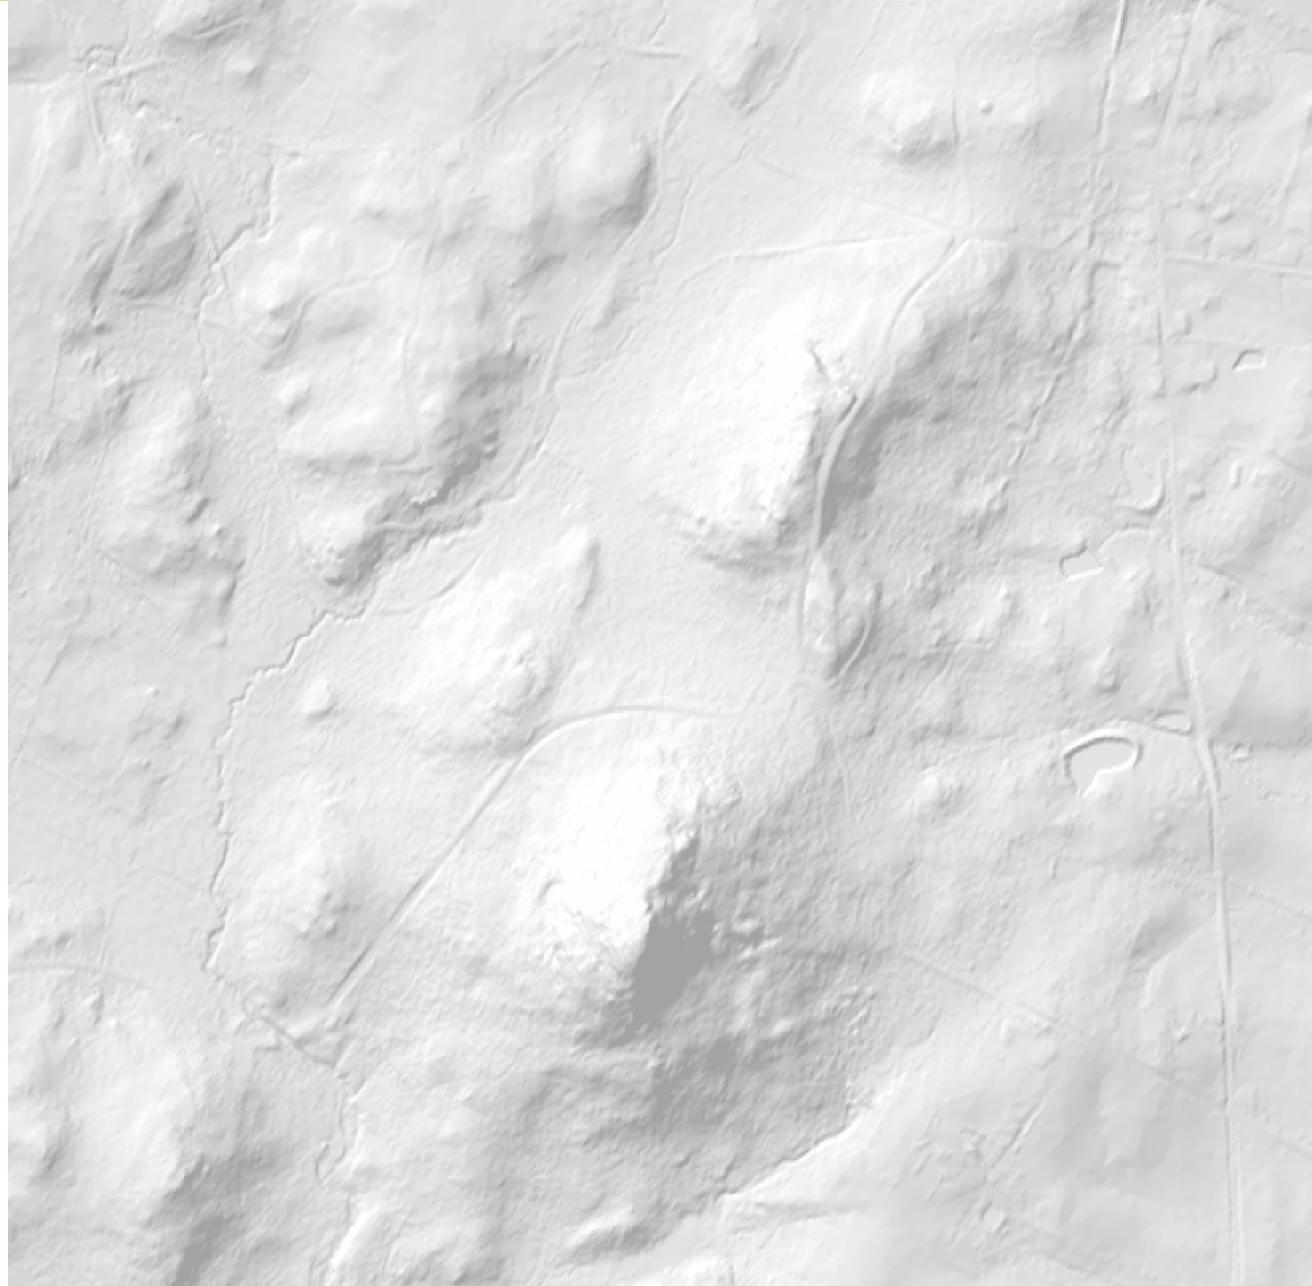

Elevation: Shaded Relief

- Shaded relief is even more intuitive

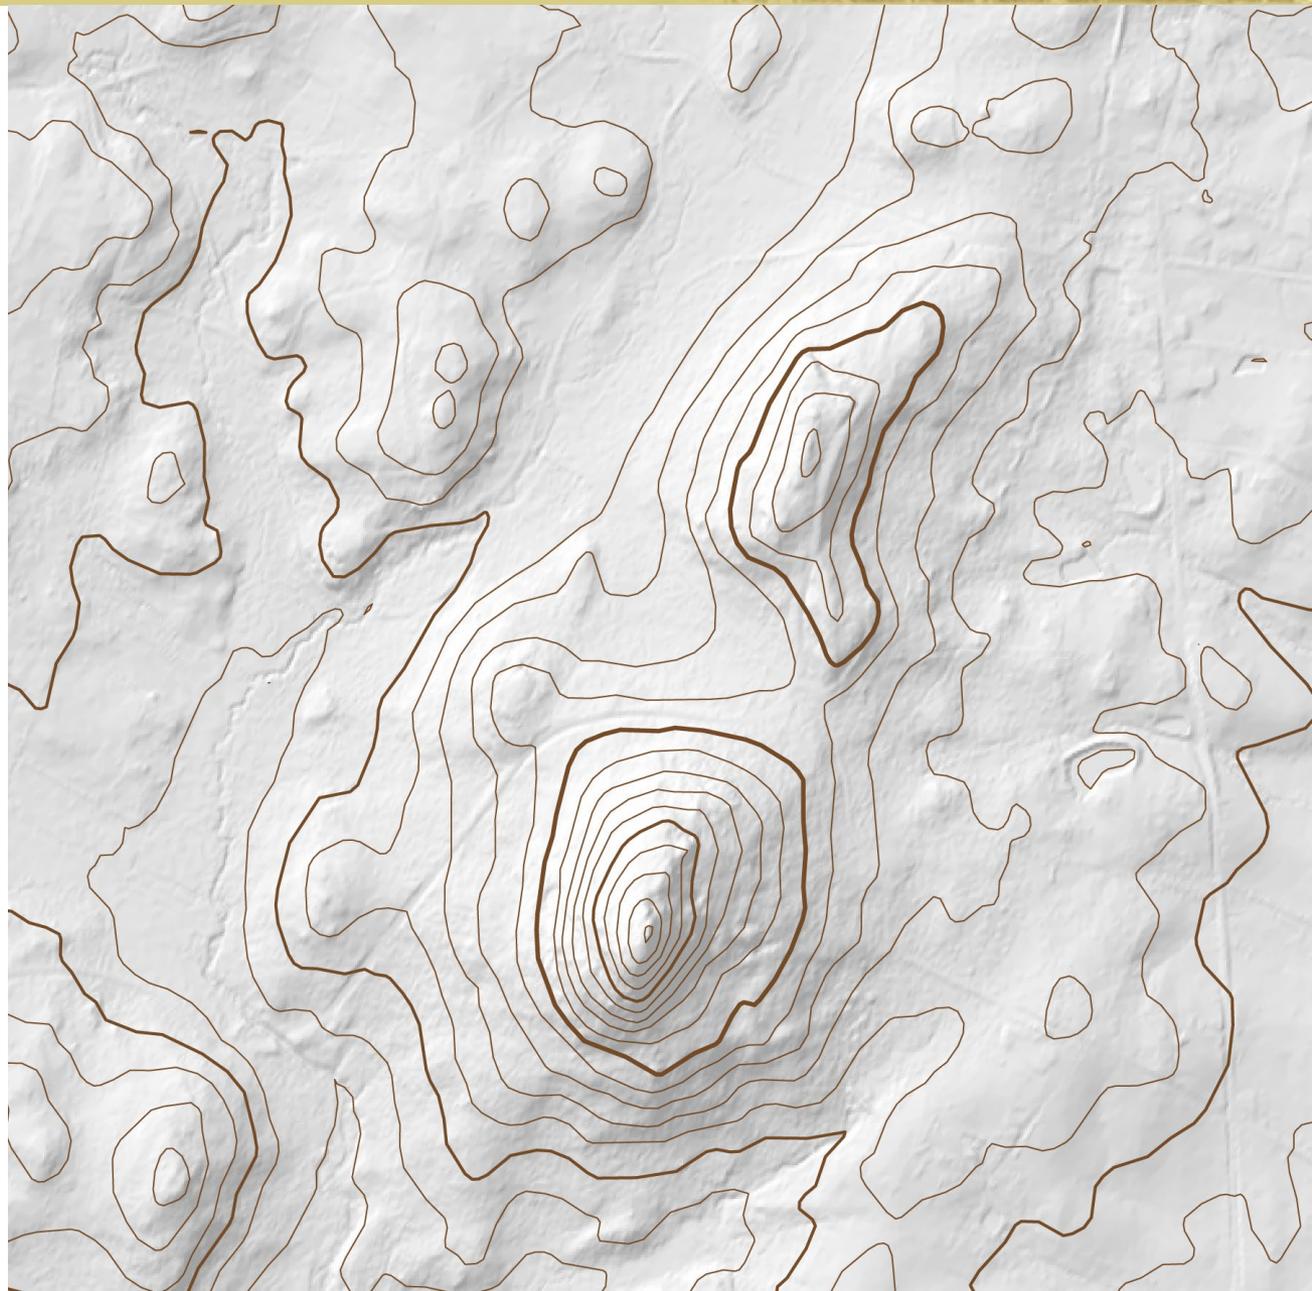

Elevation: Shaded Relief, II

- Pseudo 3-D effect for hills and valleys

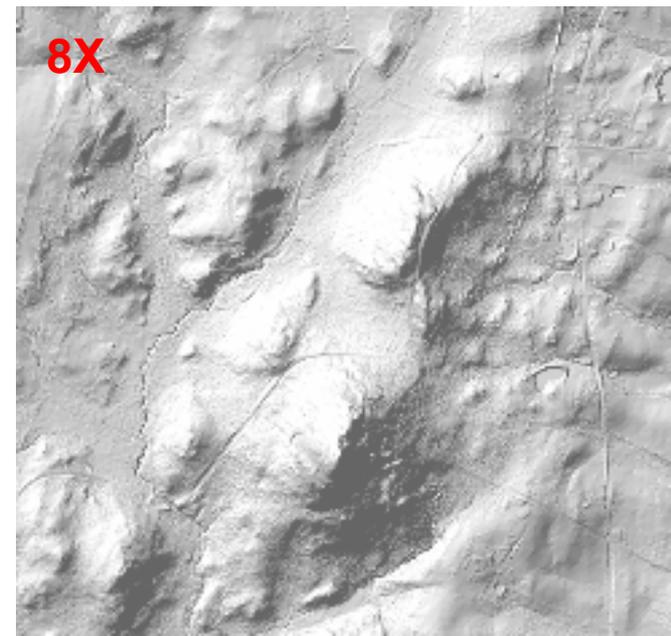

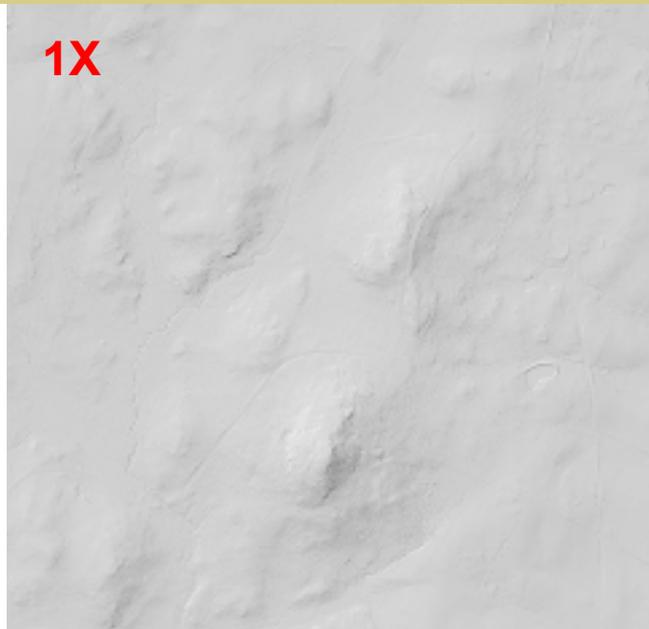

Elevation: Shaded Relief, III

- Combining shaded relief with contour lines can be even better
- Works best for relatively small battlefield areas

Elevation Exaggeration

- Exaggeration provides more “natural” look
- Battlefields 4X, theater 6–12X
- Sun altitude and azimuth also can be adjusted; here, $40^\circ/315^\circ$, or upper left corner

Shaded Relief: DEM

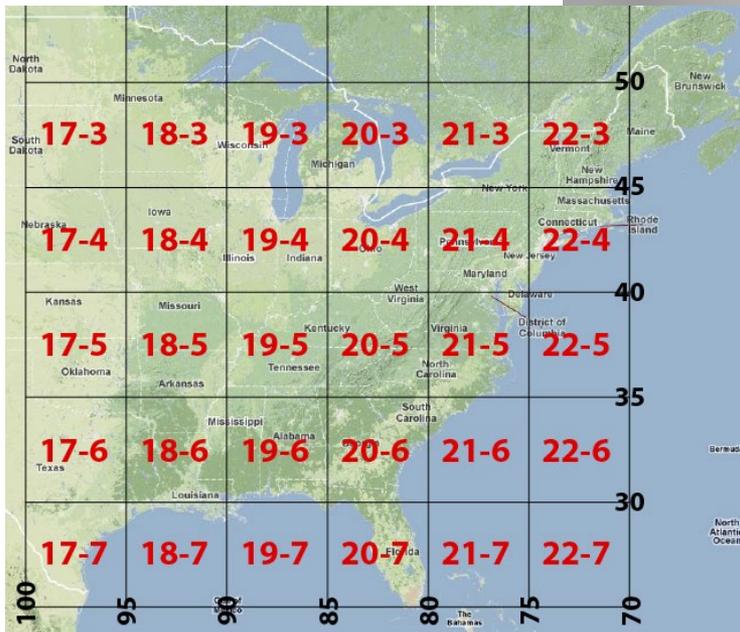

- Digital Elevation Model (DEM) data is manipulated by Global Mapper to create the pseudo 3-D shading effect
- Government DEM available for free, in different resolutions

Grid	Resolution	Source
3 arc-seconds	90 meters	SRTM (Shuttle Radar Topography Mission) worldwide dataset
1.5 arc-seconds	45 meters	ASTER (Advanced Spaceborne Thermal Emission and Reflection Radiometer)
1 arc-second	30 meters	SRTM US-only
1/3 arc-second	10 meters	NED (National Elevation Data), all US
1/9 arc-second	3 meters	NED, selected US areas, mostly coastal

1 arc-second = $1/1,296,000^{\text{th}}$ of Earth's circumference

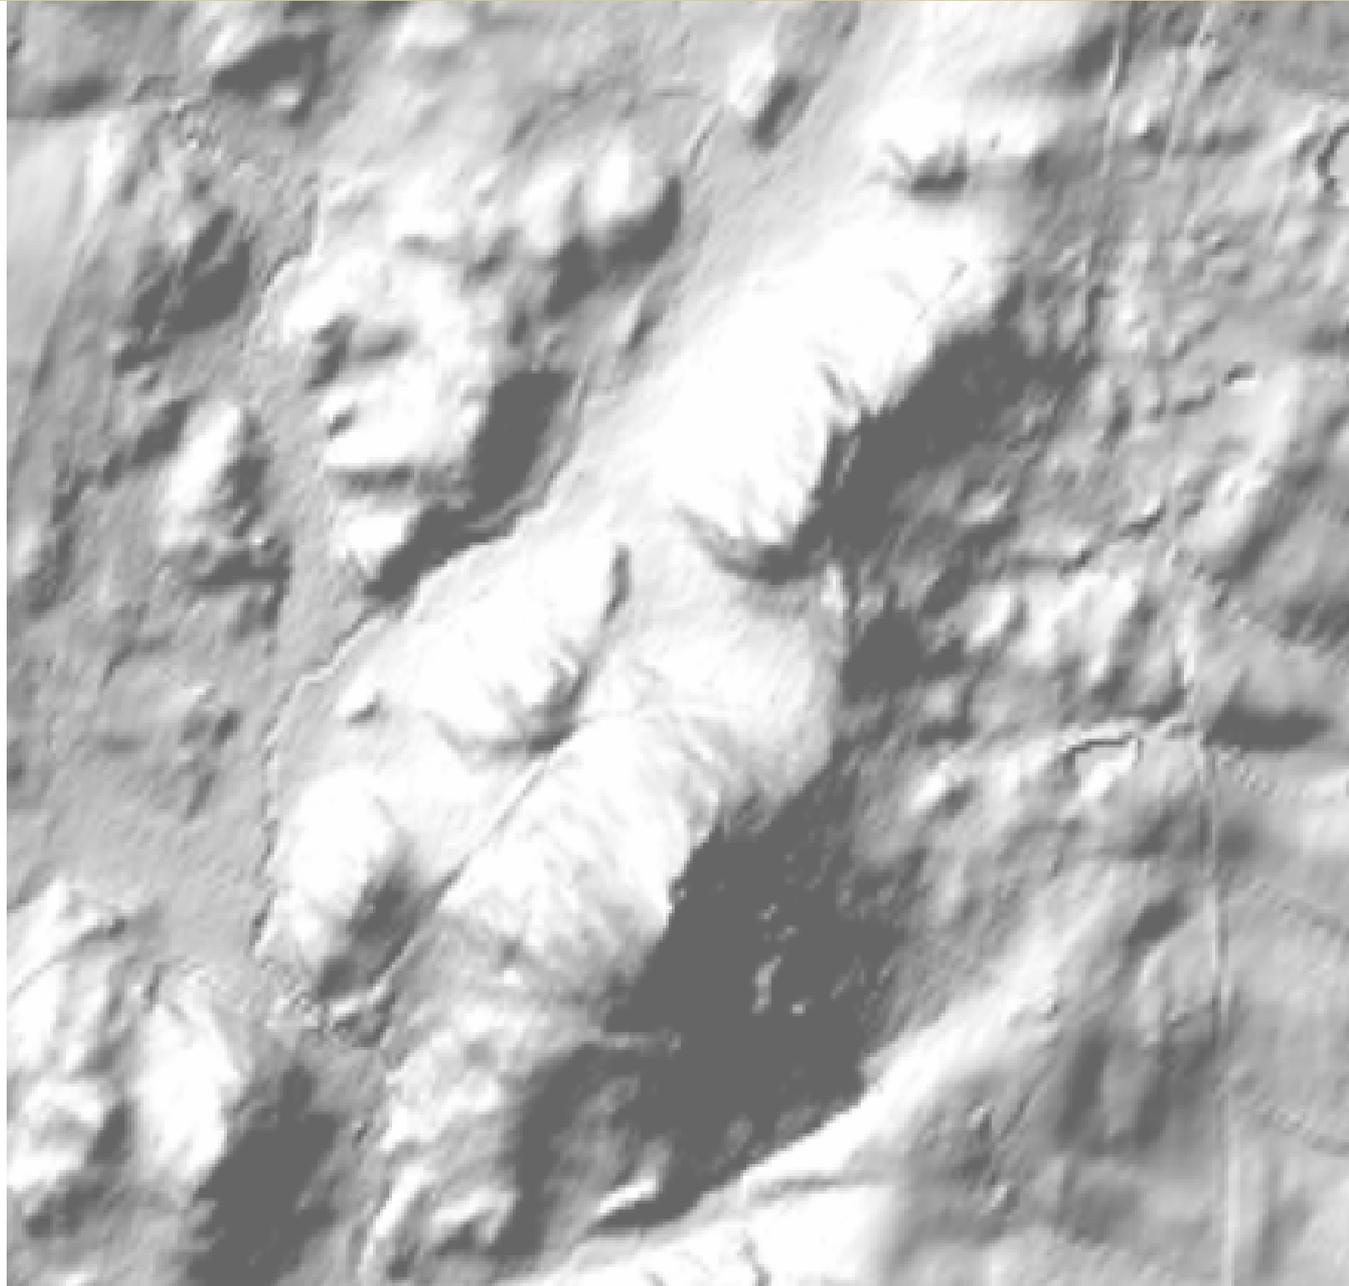

DEM Examples: SRTM 30m, 1 arc-sec

- Useful only for wide areas (campaigns, theaters)

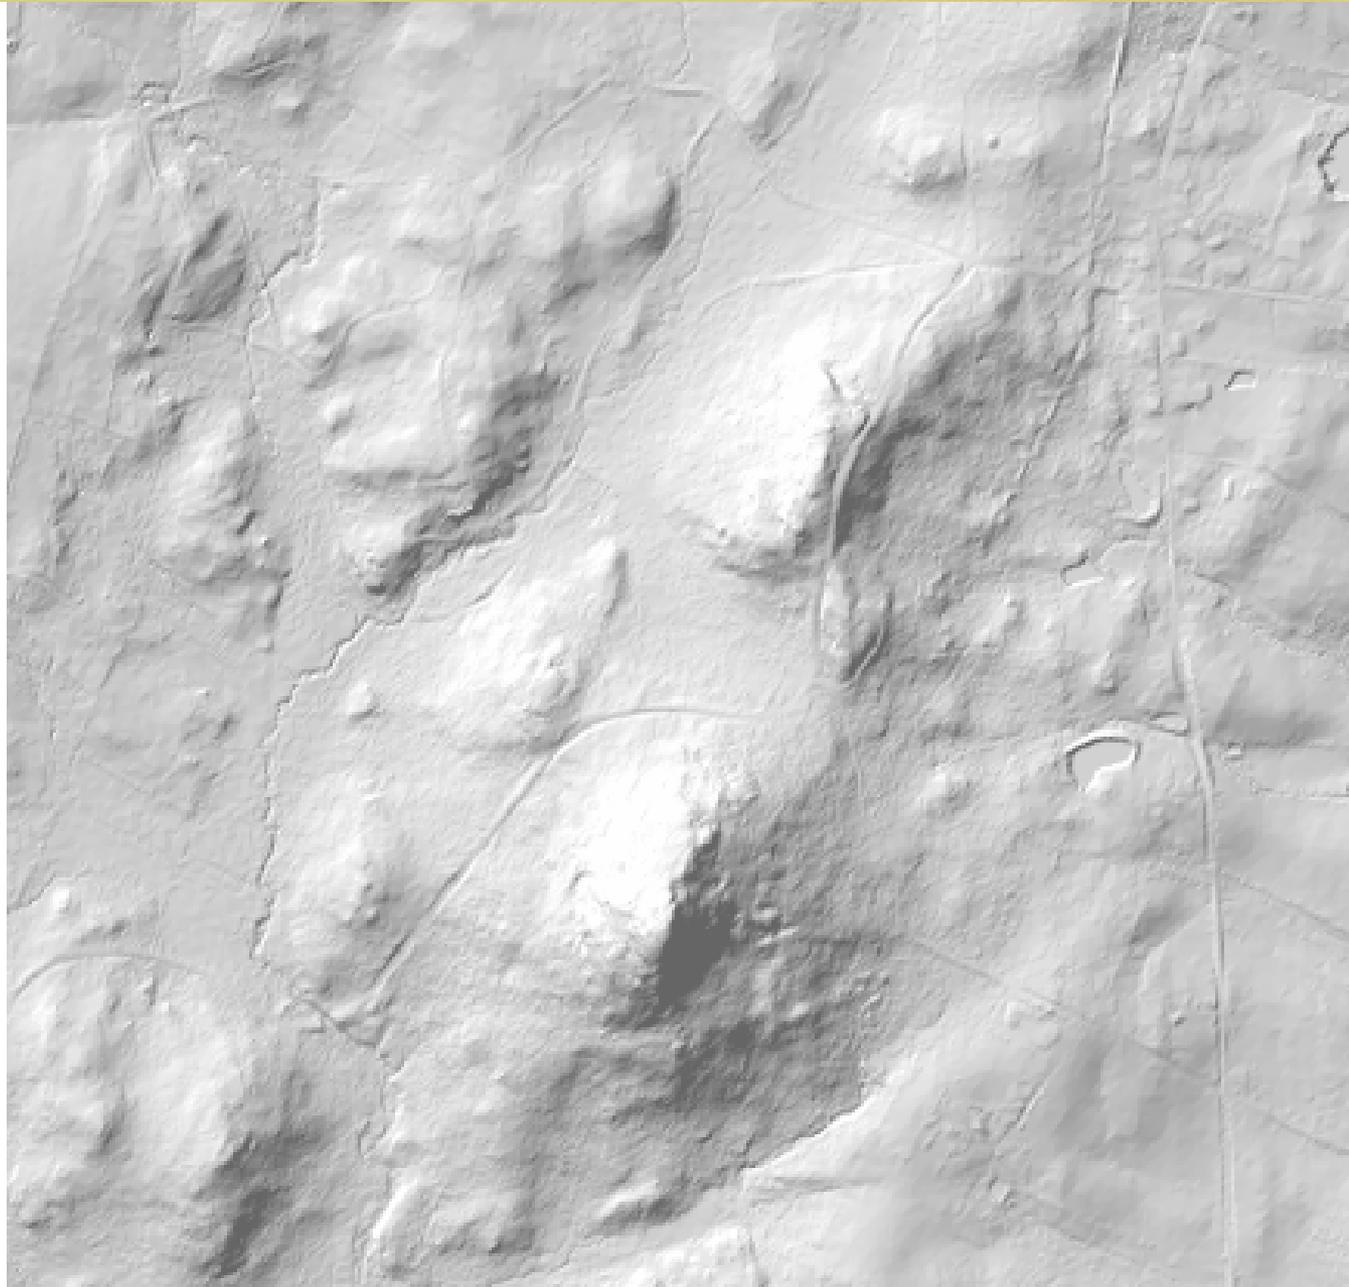

DEM Examples: NED 10m, 1/3 arc-sec

- Mostly used for battlefield maps

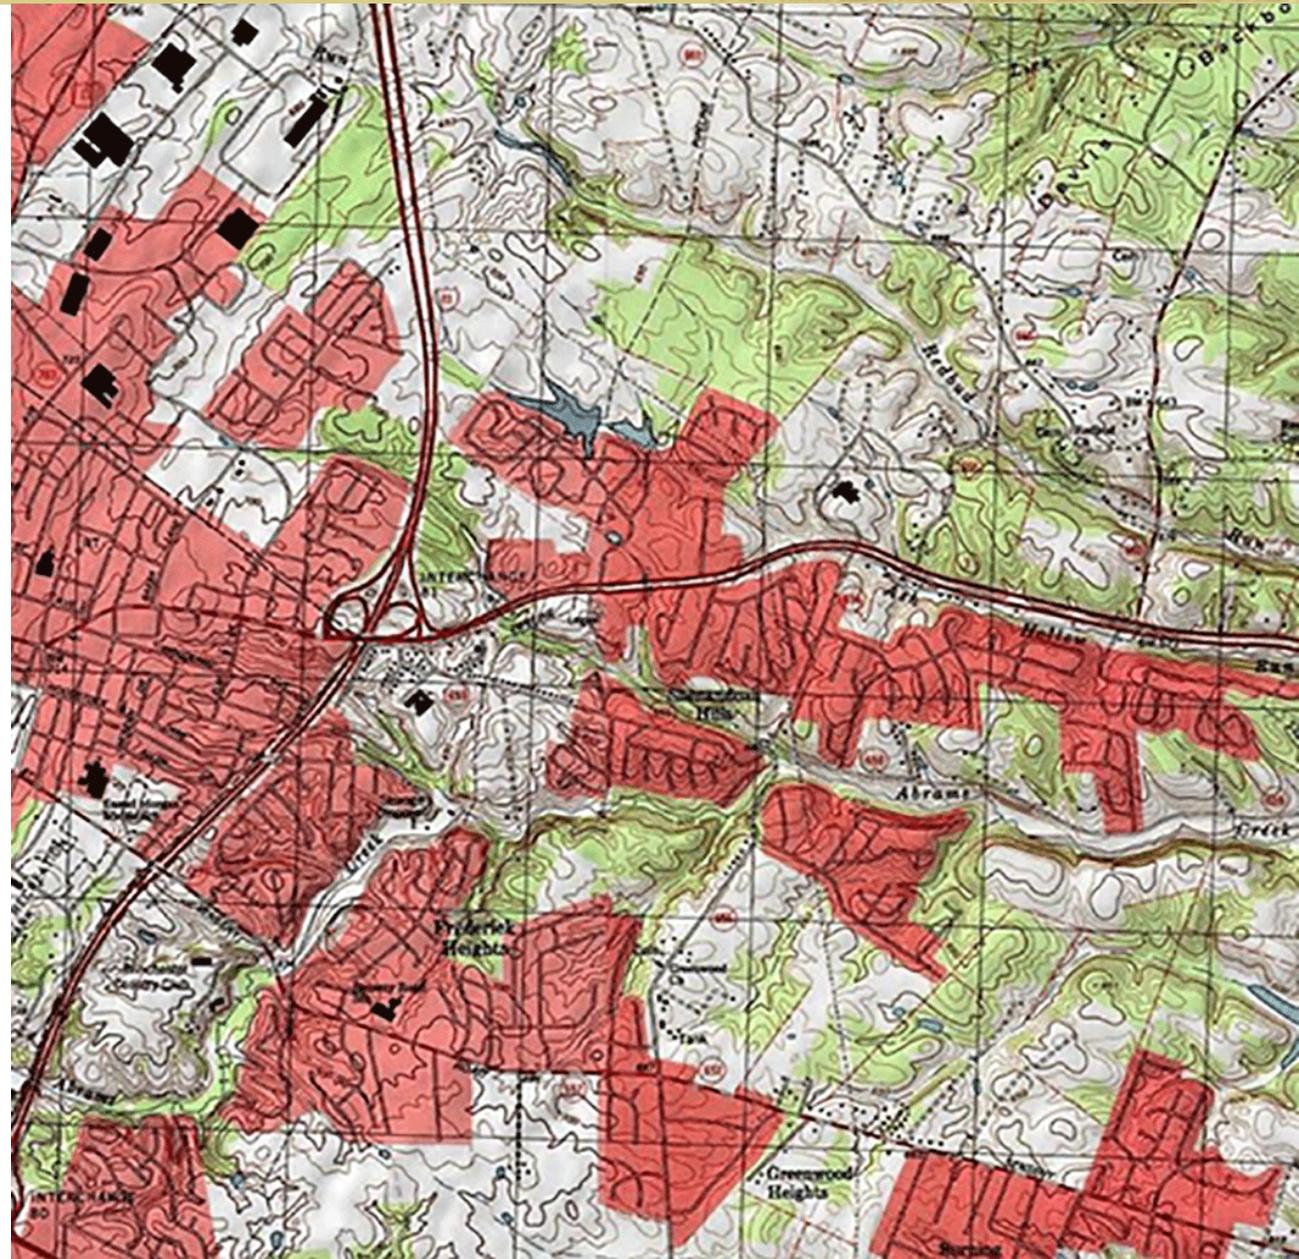

DEM Examples: NED 3m, 1/9 arc-sec

- Rarely available for Civil War battlefields
- Lots of cleanup is necessary

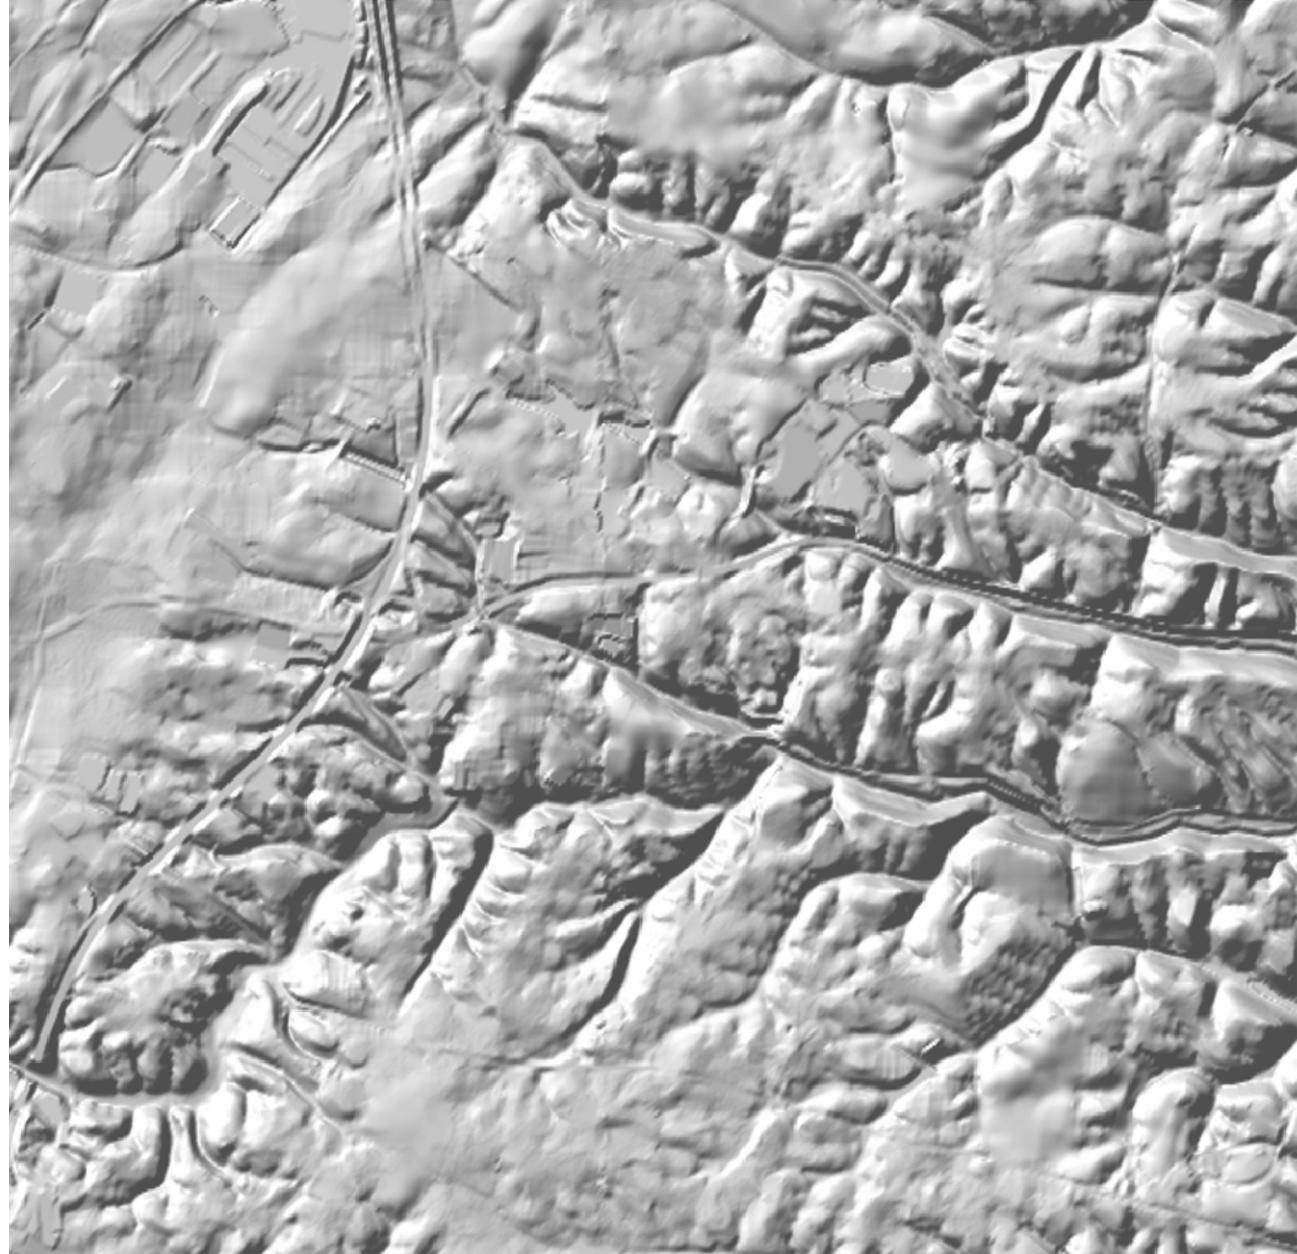

Cleanup

Third Winchester
Battlefield – USGS

Cleanup, II

Raw Global Mapper
Output, 4X

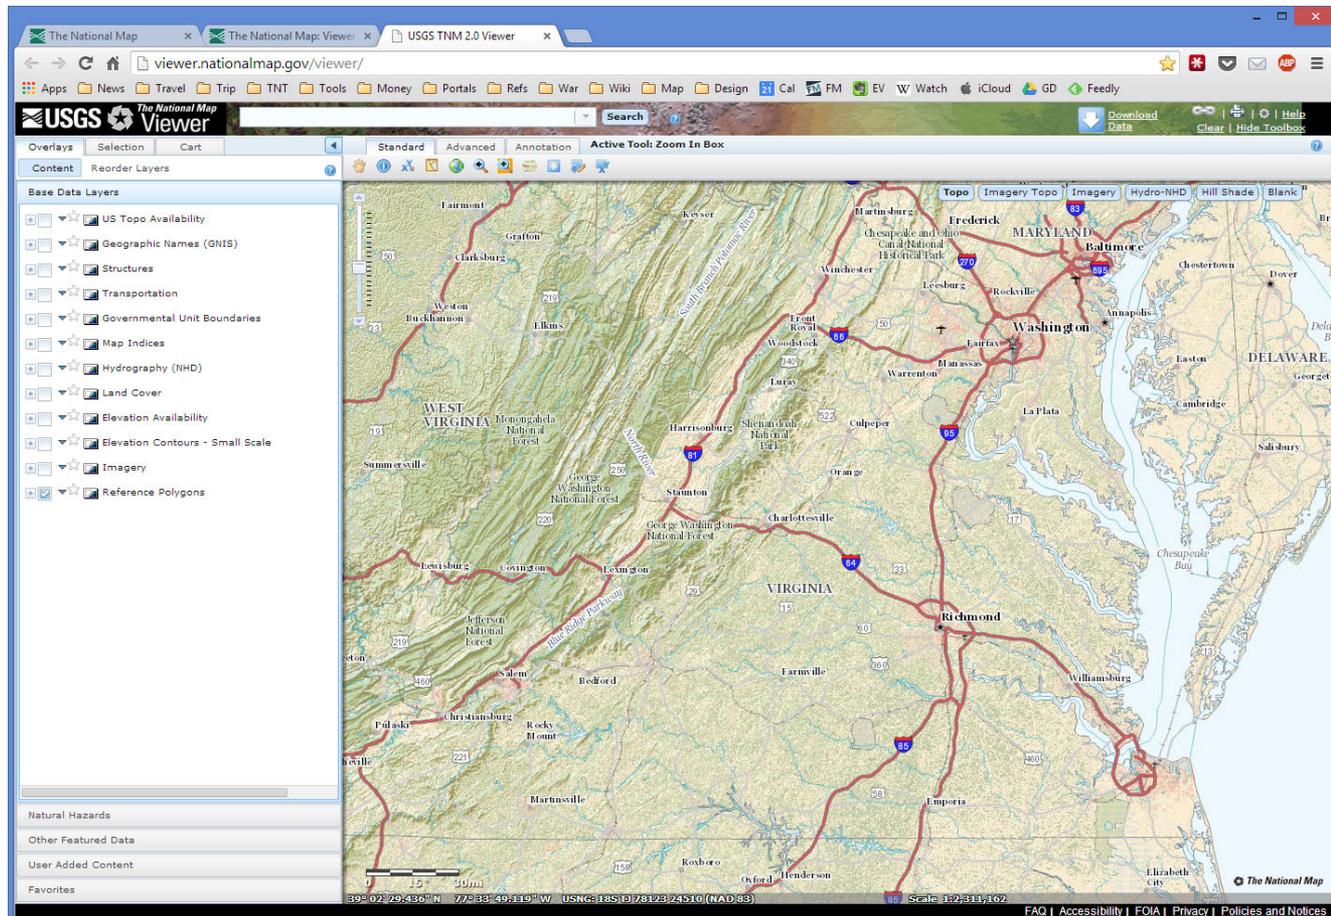

Cleanup, III

Cleanup with
Photoshop

Other Public Domain Data Sources

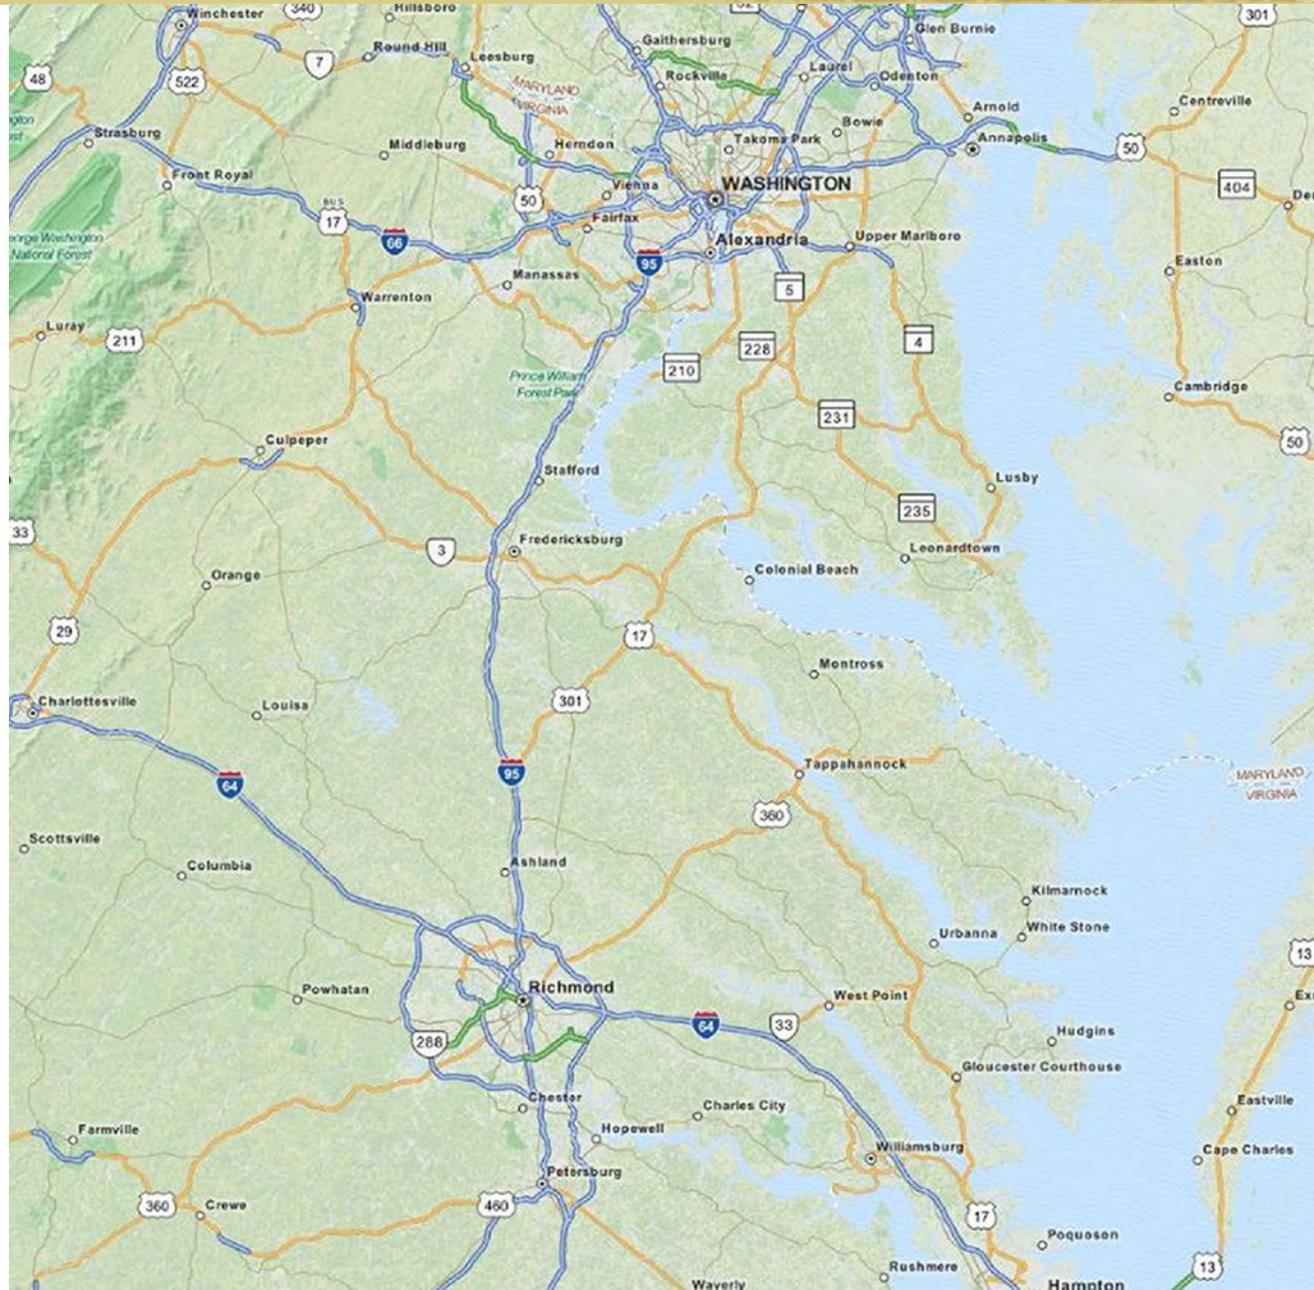

- USGS National Map
 - State and county boundaries
 - Rivers and lakes
 - Highways
 - Railroads

viewer.nationalmap.gov

USGS National Map

- Lots of high-level data

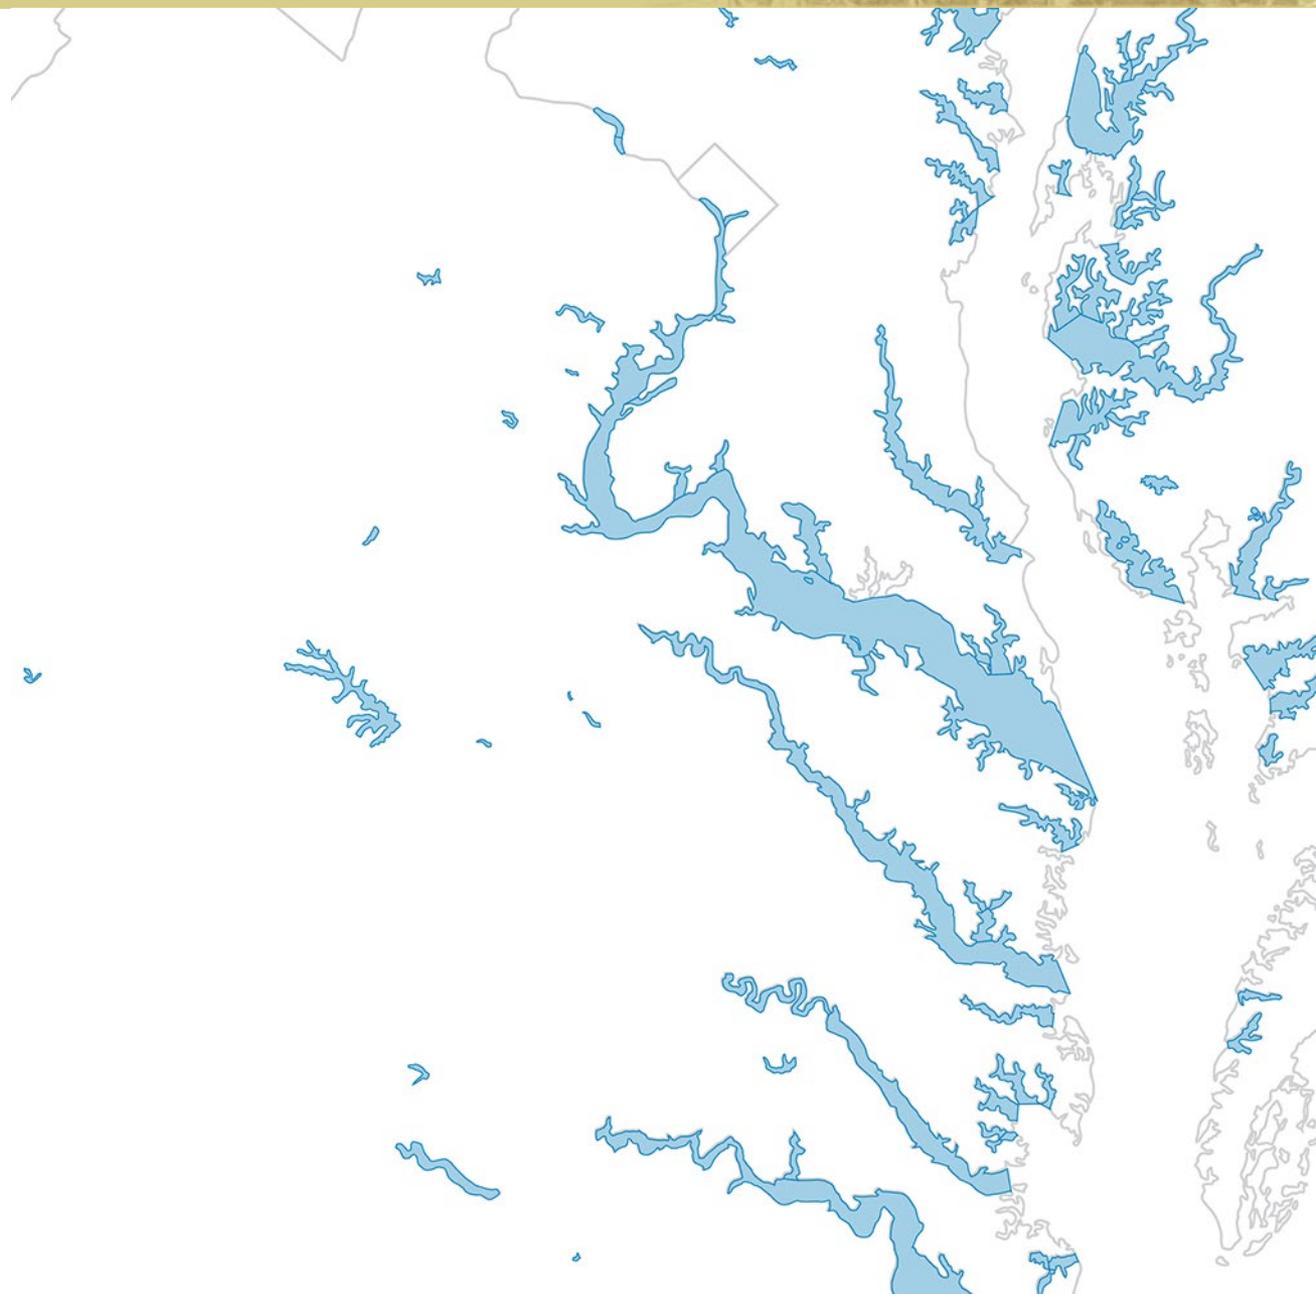

Open Street Map
background

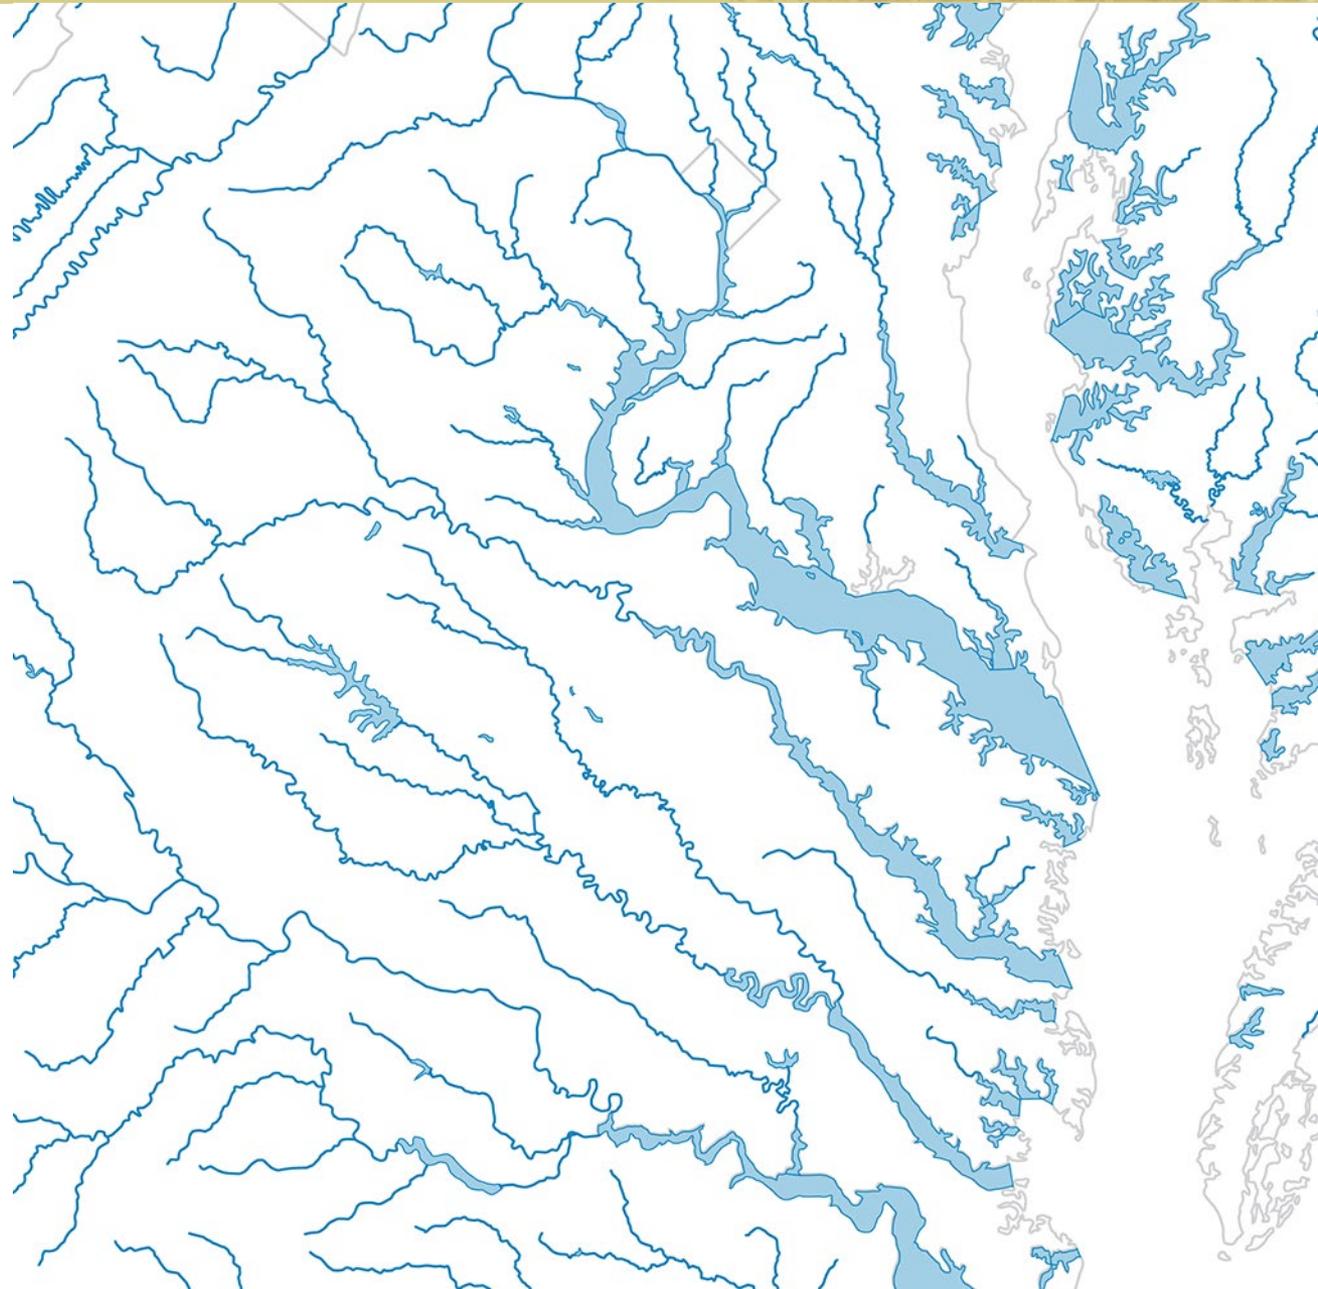

National Atlas: State Outlines

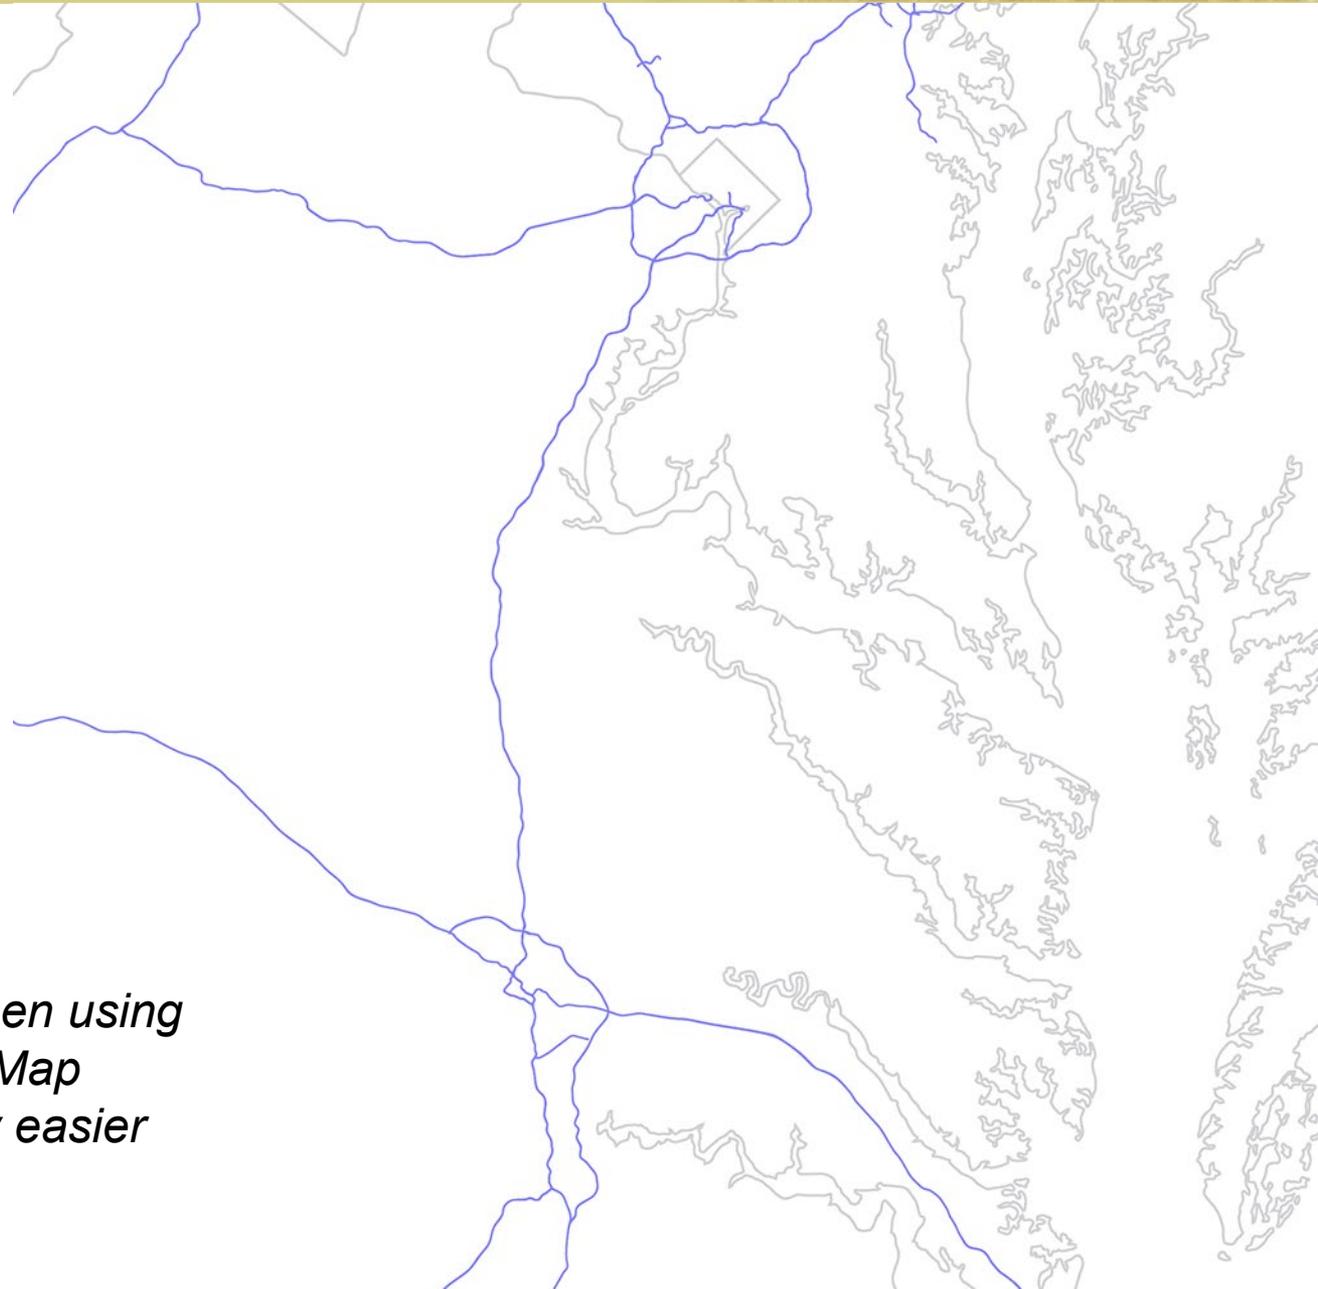

National Atlas: Lakes, Big Rivers

National Atlas: Rivers

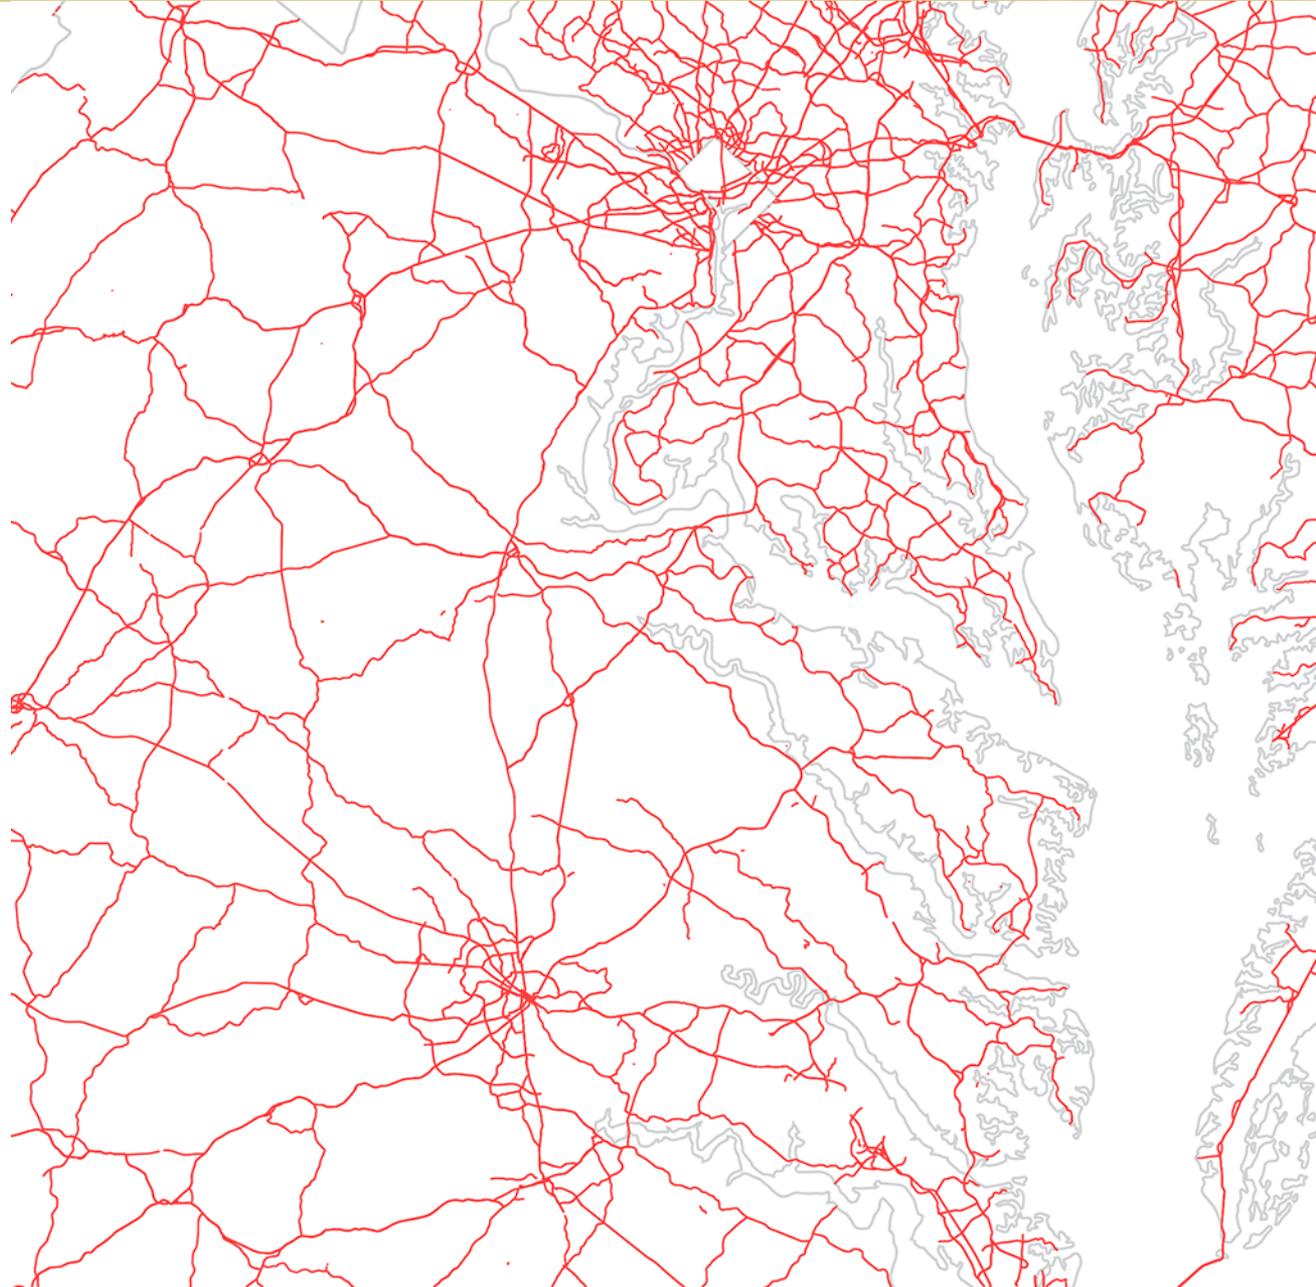

National Atlas: Primary Roads

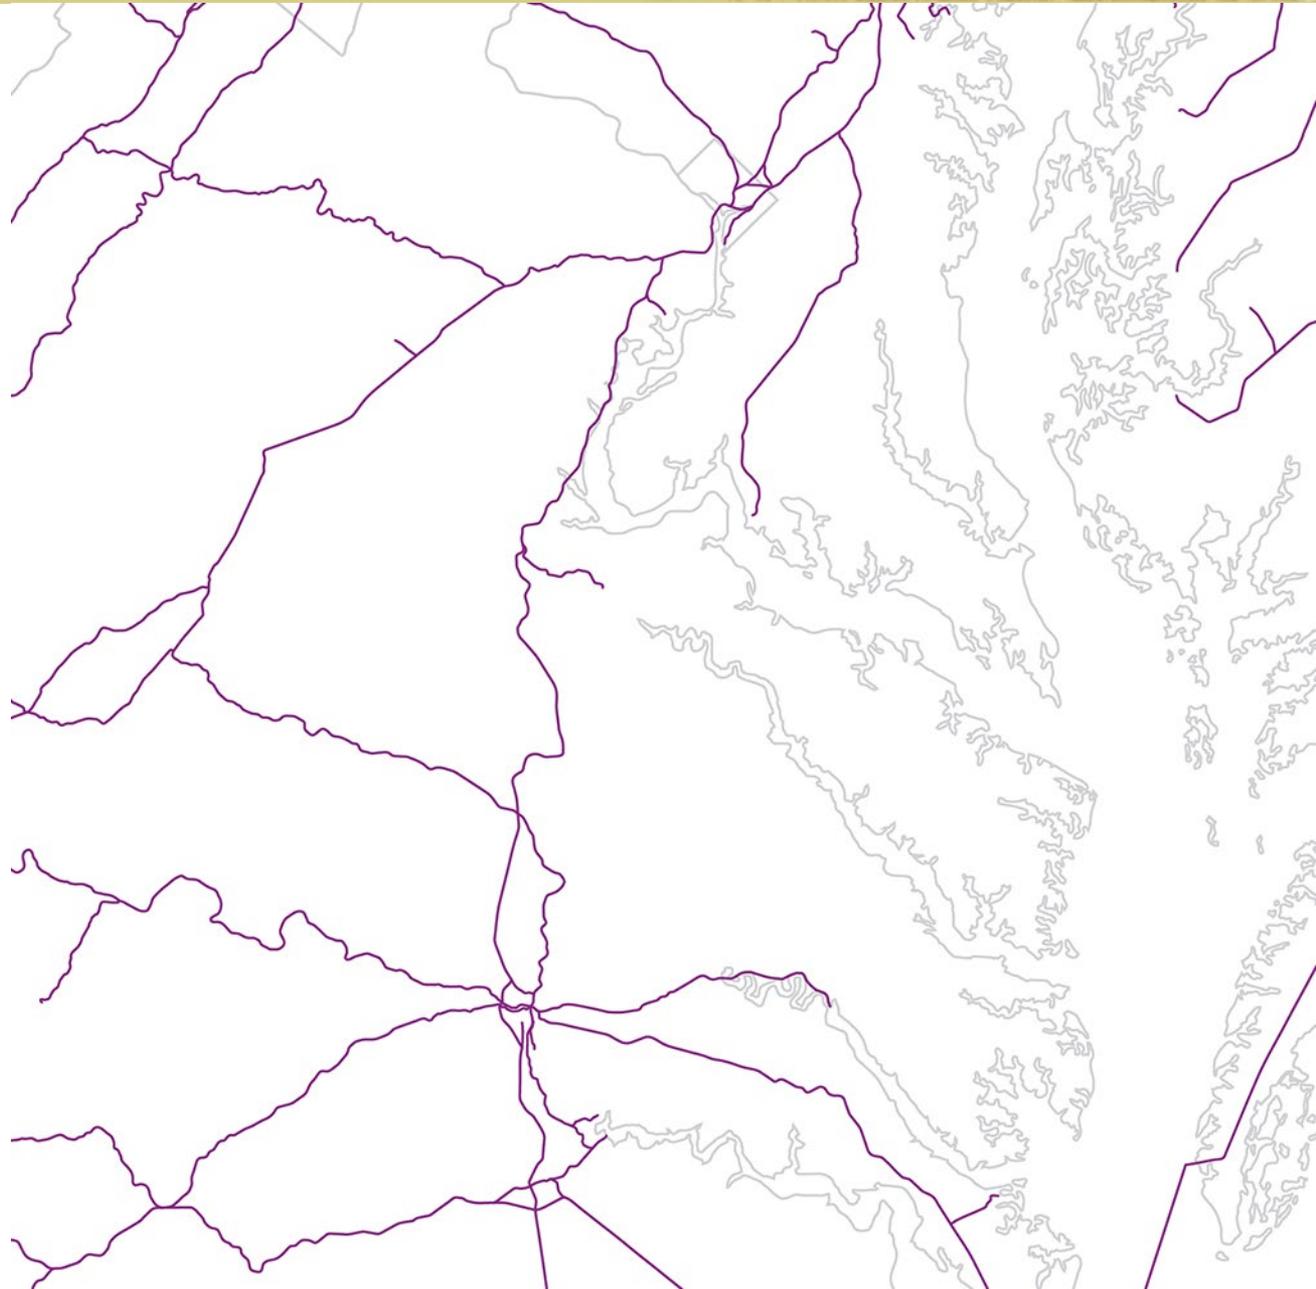

In recent years I have been using roads from Open Street Map because they are slightly easier to work with

National Atlas: Secondary Roads

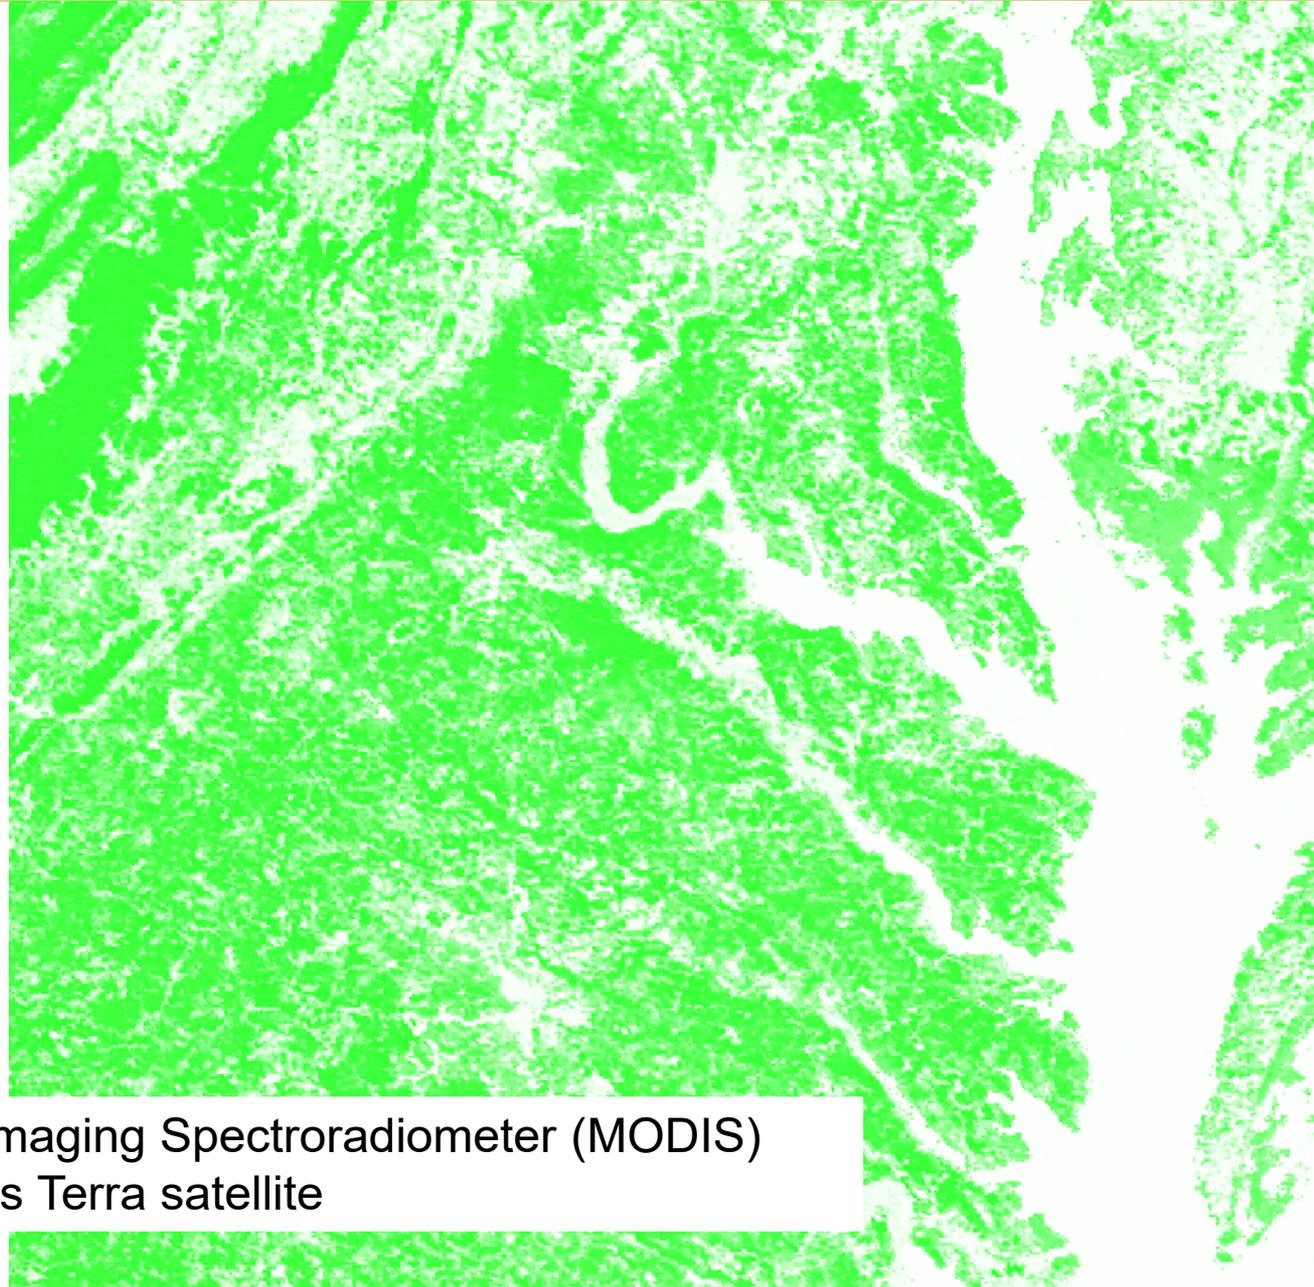

National Atlas: Railroads

Tree Cover

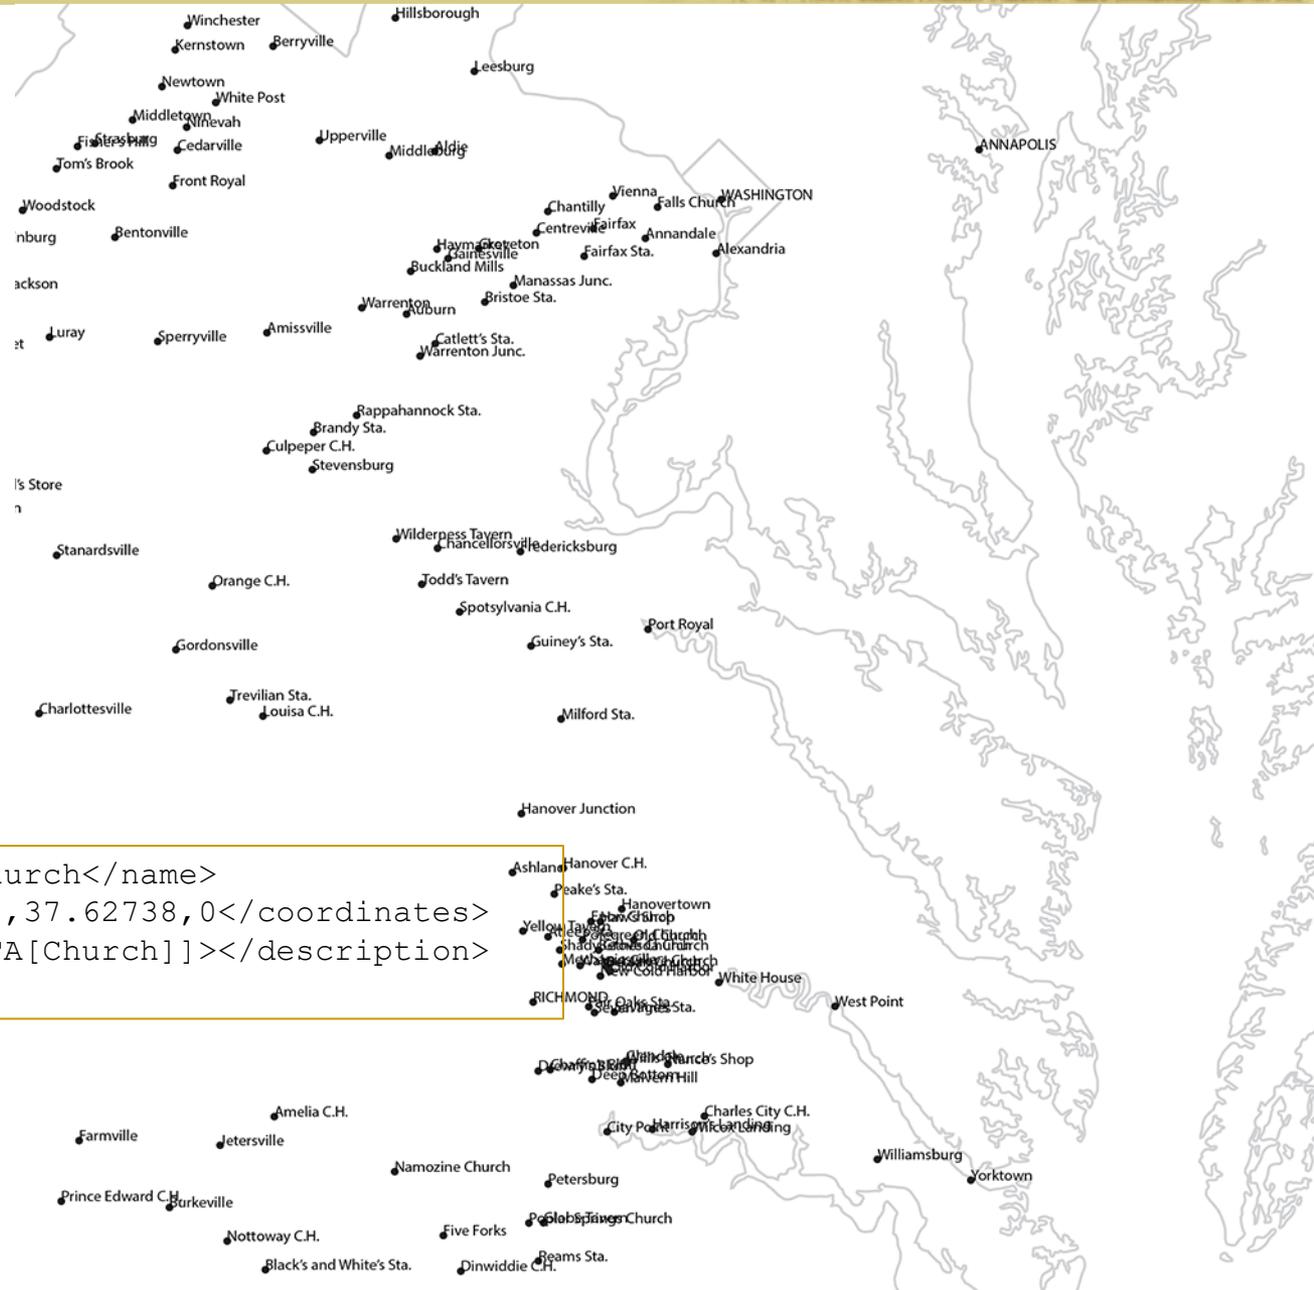

- Landsat Vegetation Continuous Fields (VCF) database
- 1 pixel = 30 meters
- Only useful for wide areas

MODerate-resolution Imaging Spectroradiometer (MODIS)
sensor onboard NASA's Terra satellite

KML Data

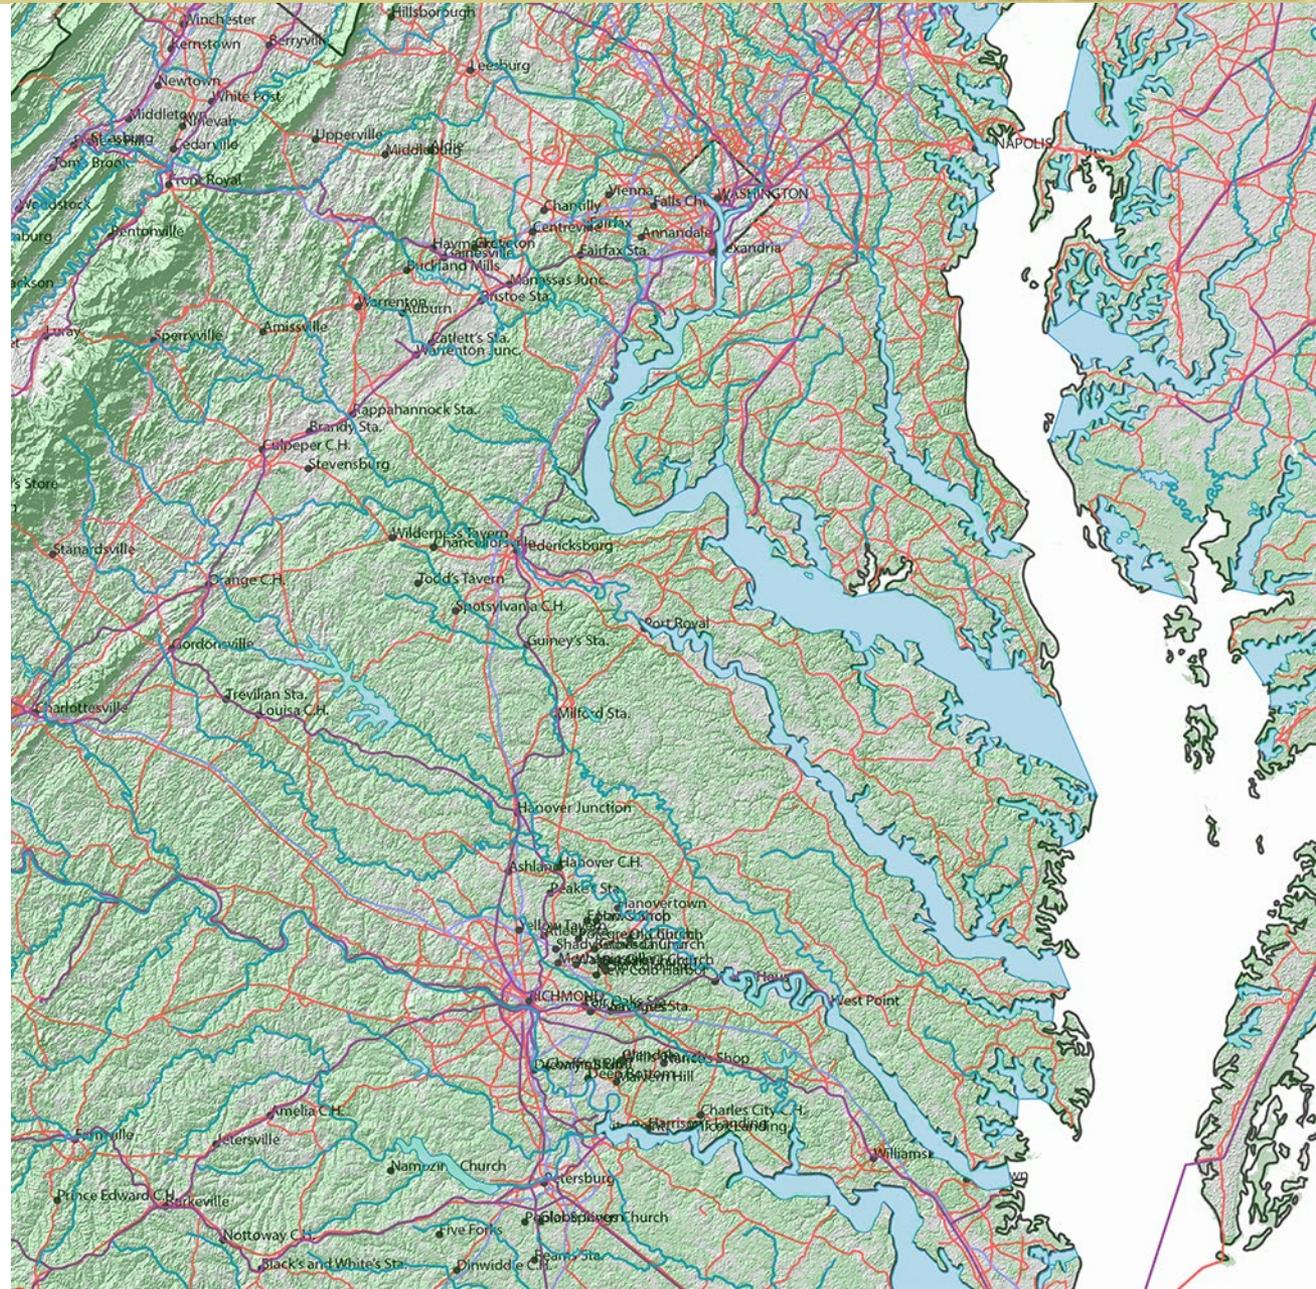

- Raw coordinates and labels
- Easy to create in Google Earth

```
<Placemark> <name>Bethesda Church</name>  
<Point><coordinates>-77.29542,37.62738,0</coordinates>  
</Point> <description><![CDATA[Church]]></description>  
</Placemark>
```

Put All the Layers Together

- Lots of work still required

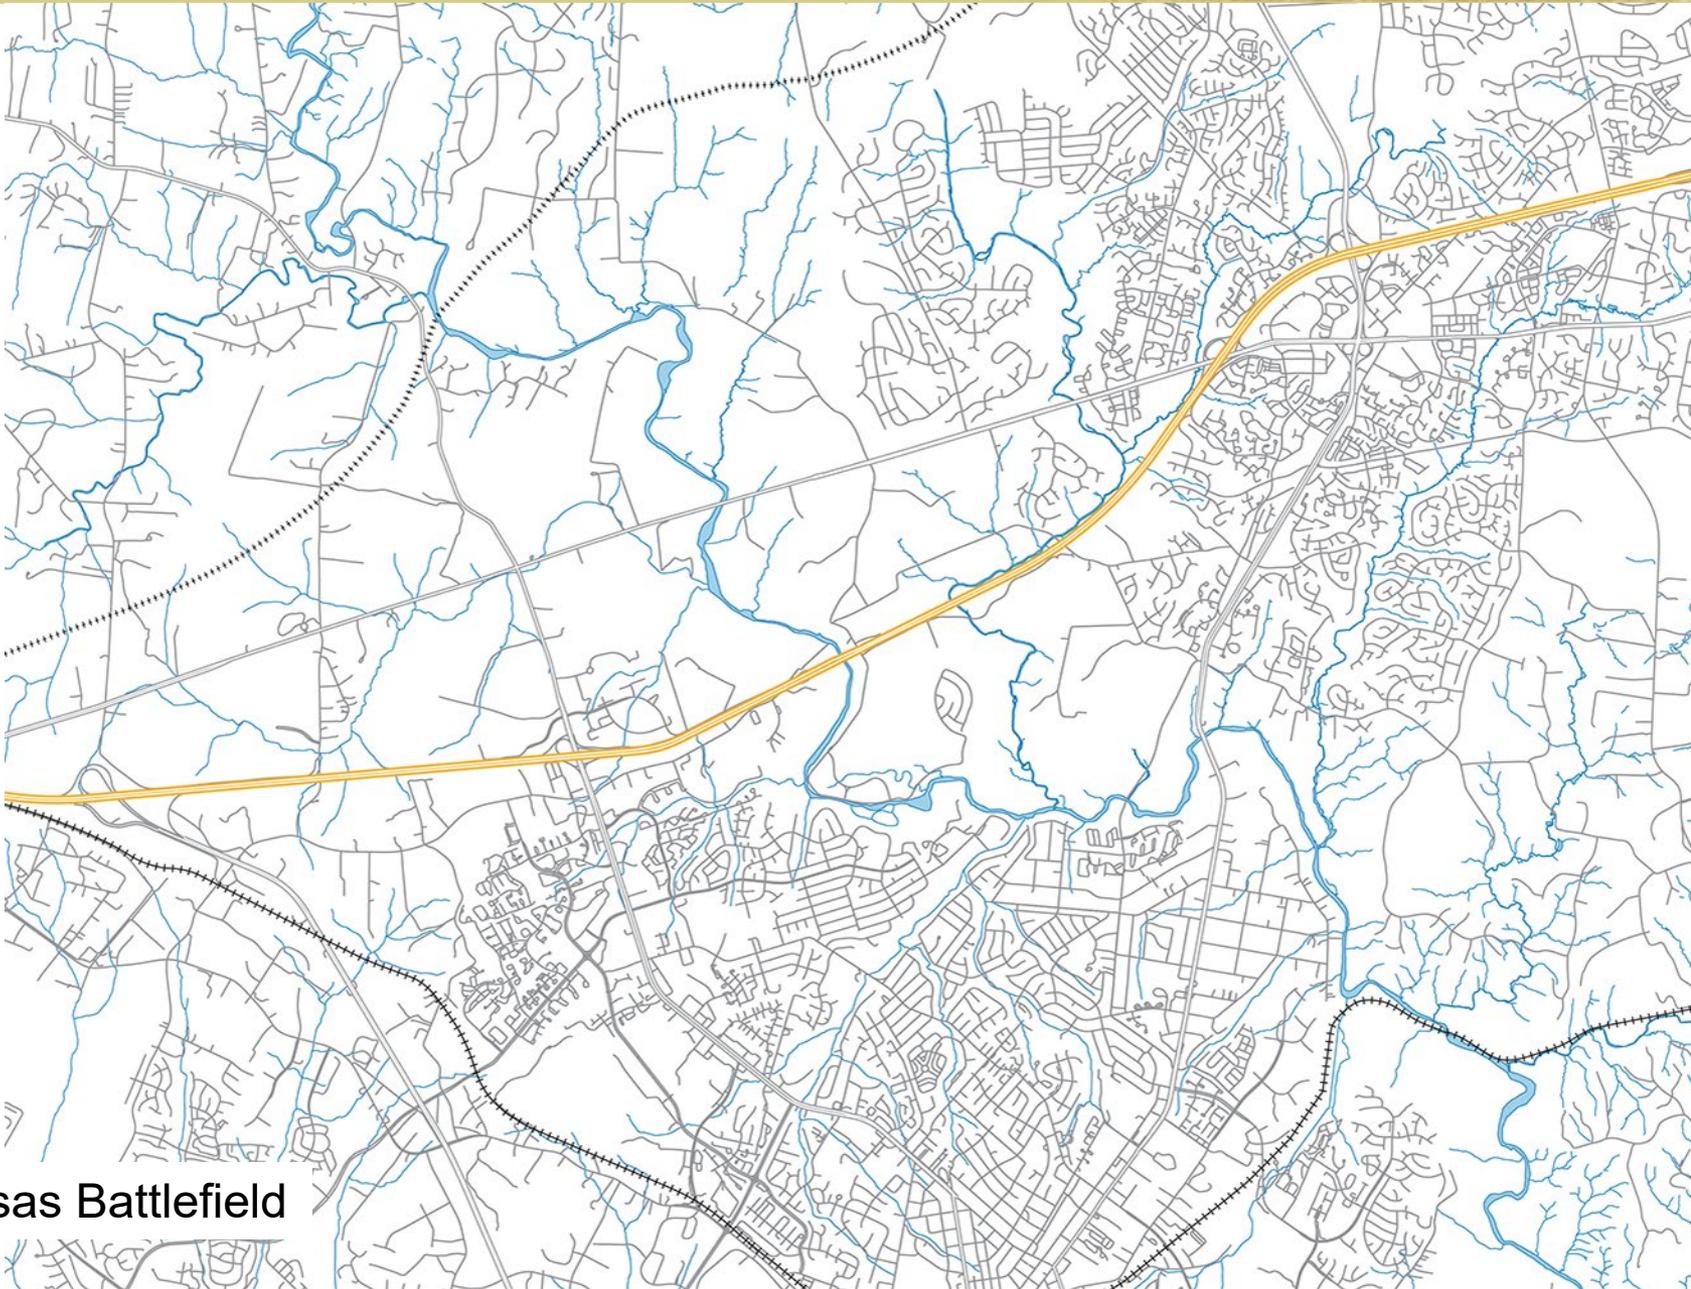

Other Public Domain Data Sources, II

- US Census Bureau
 - “Topologically Integrated Geographic Encoding and Referencing” (TIGER)
 - County-level files, abundant detail
 - Streets, alleys, highway lanes, creeks, rivers, lakes, boundaries, power lines, etc.
- Open Street Map & Natural Earth projects
 - Similar to USGS National Atlas, but worldwide, and community supported

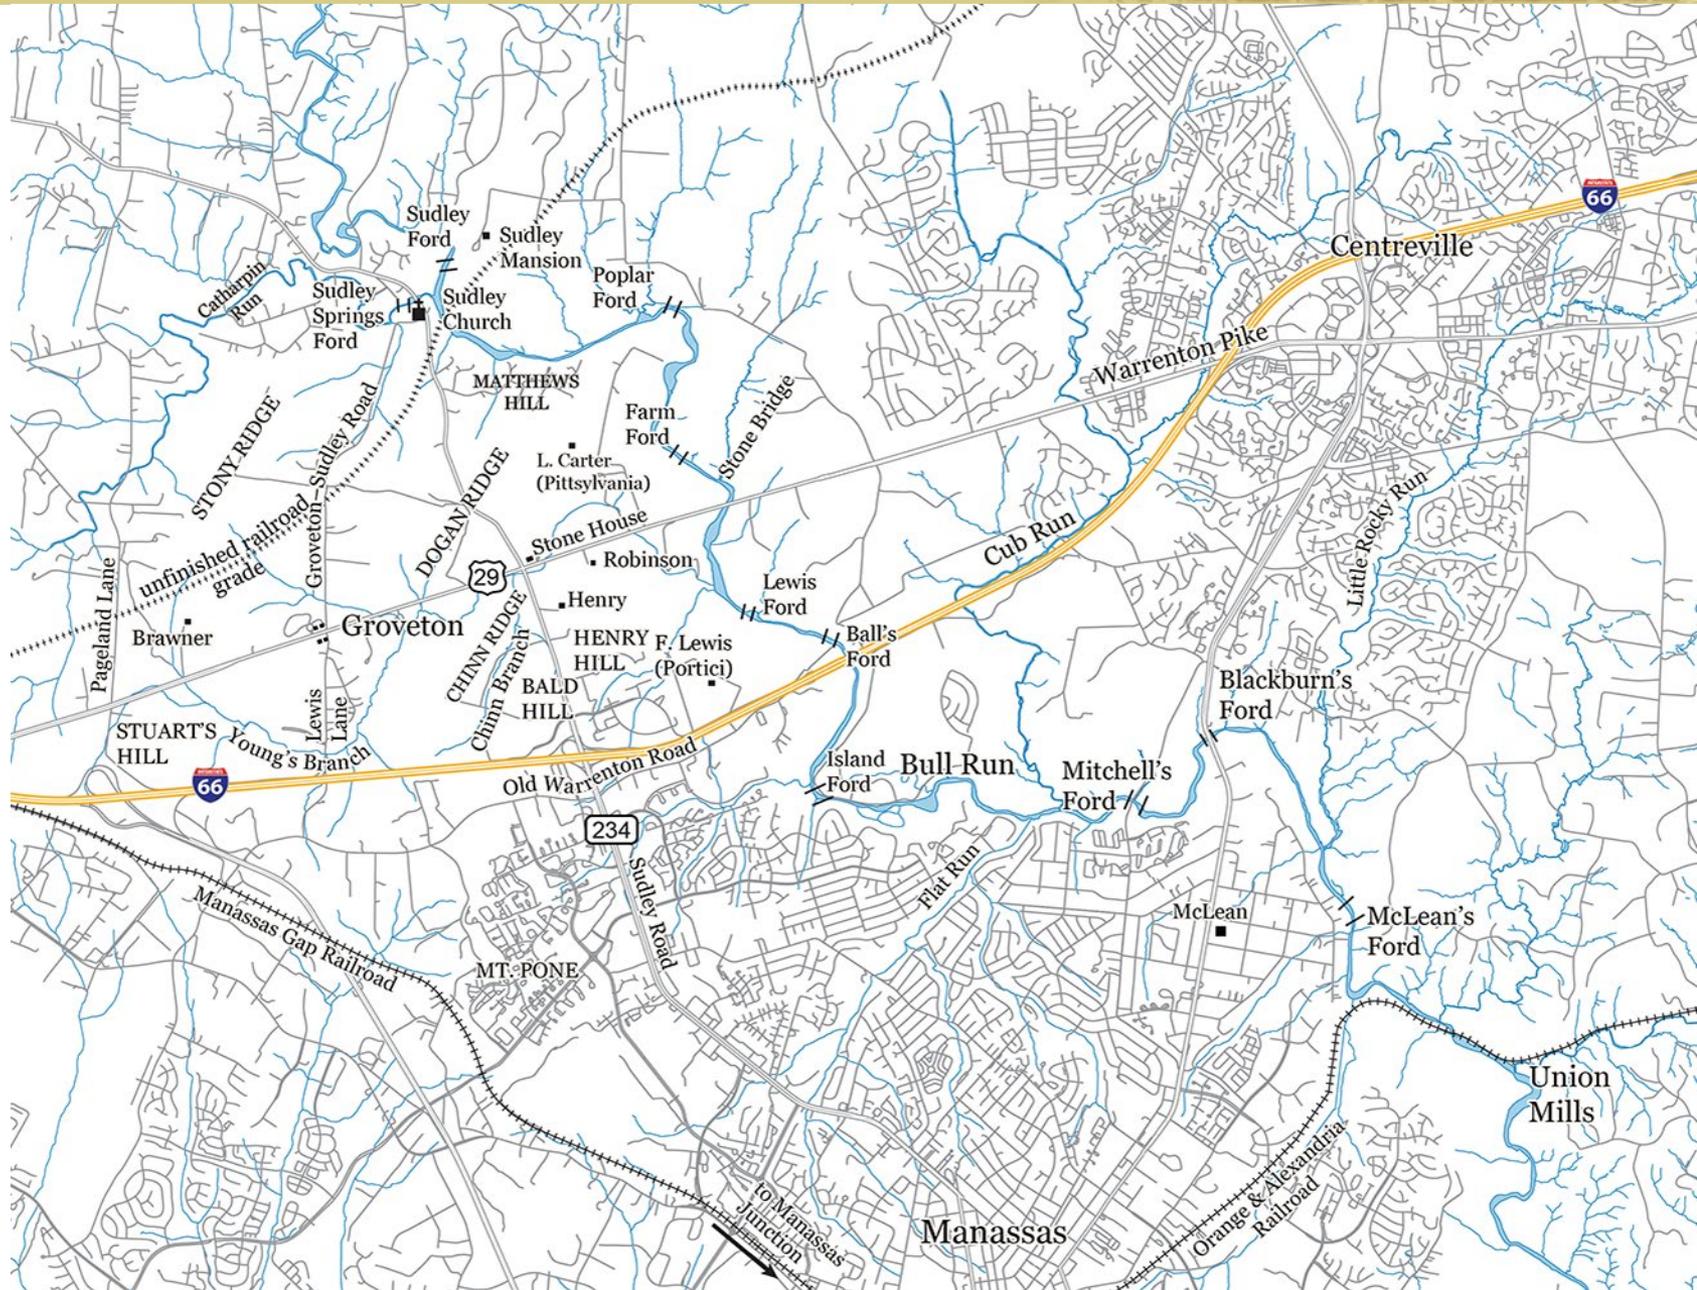

TIGER

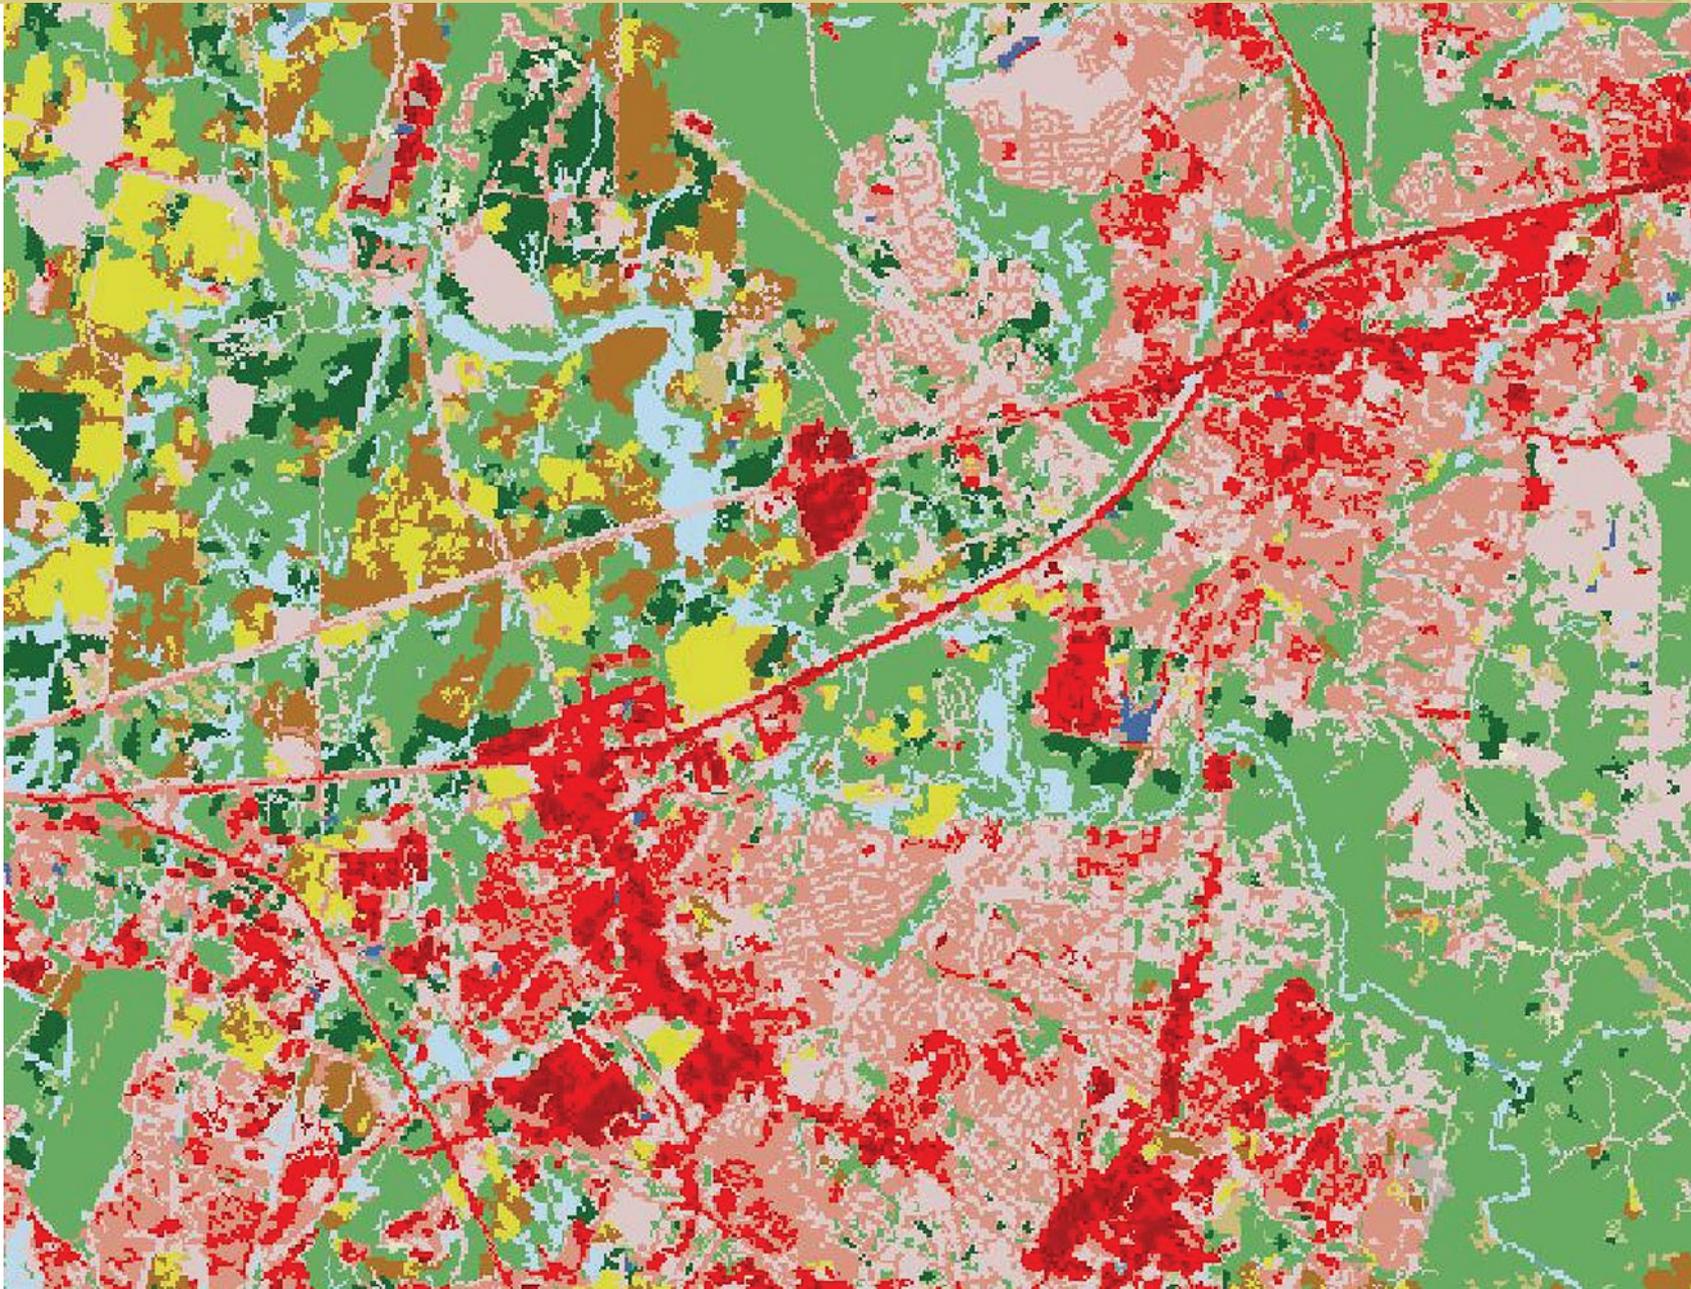

Manassas Battlefield

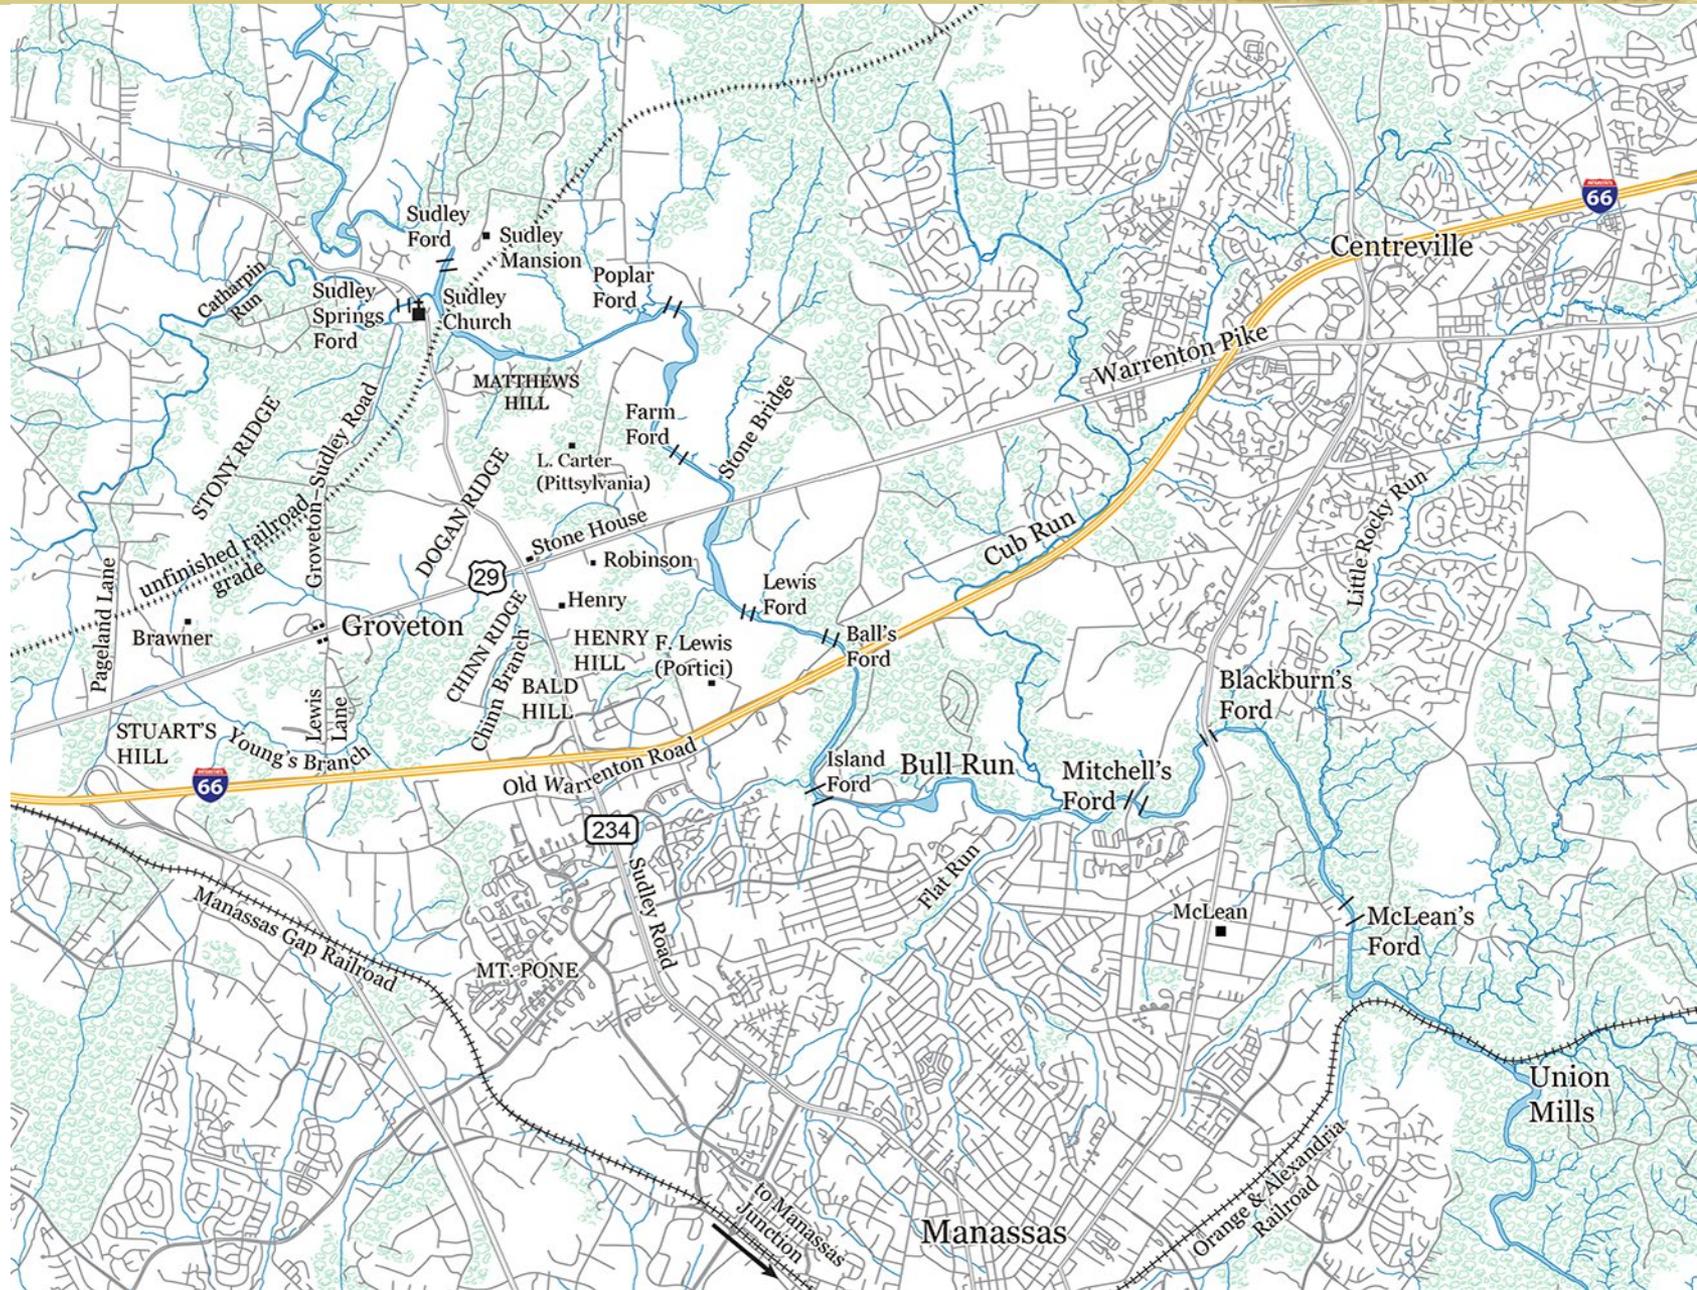

TIGER, II

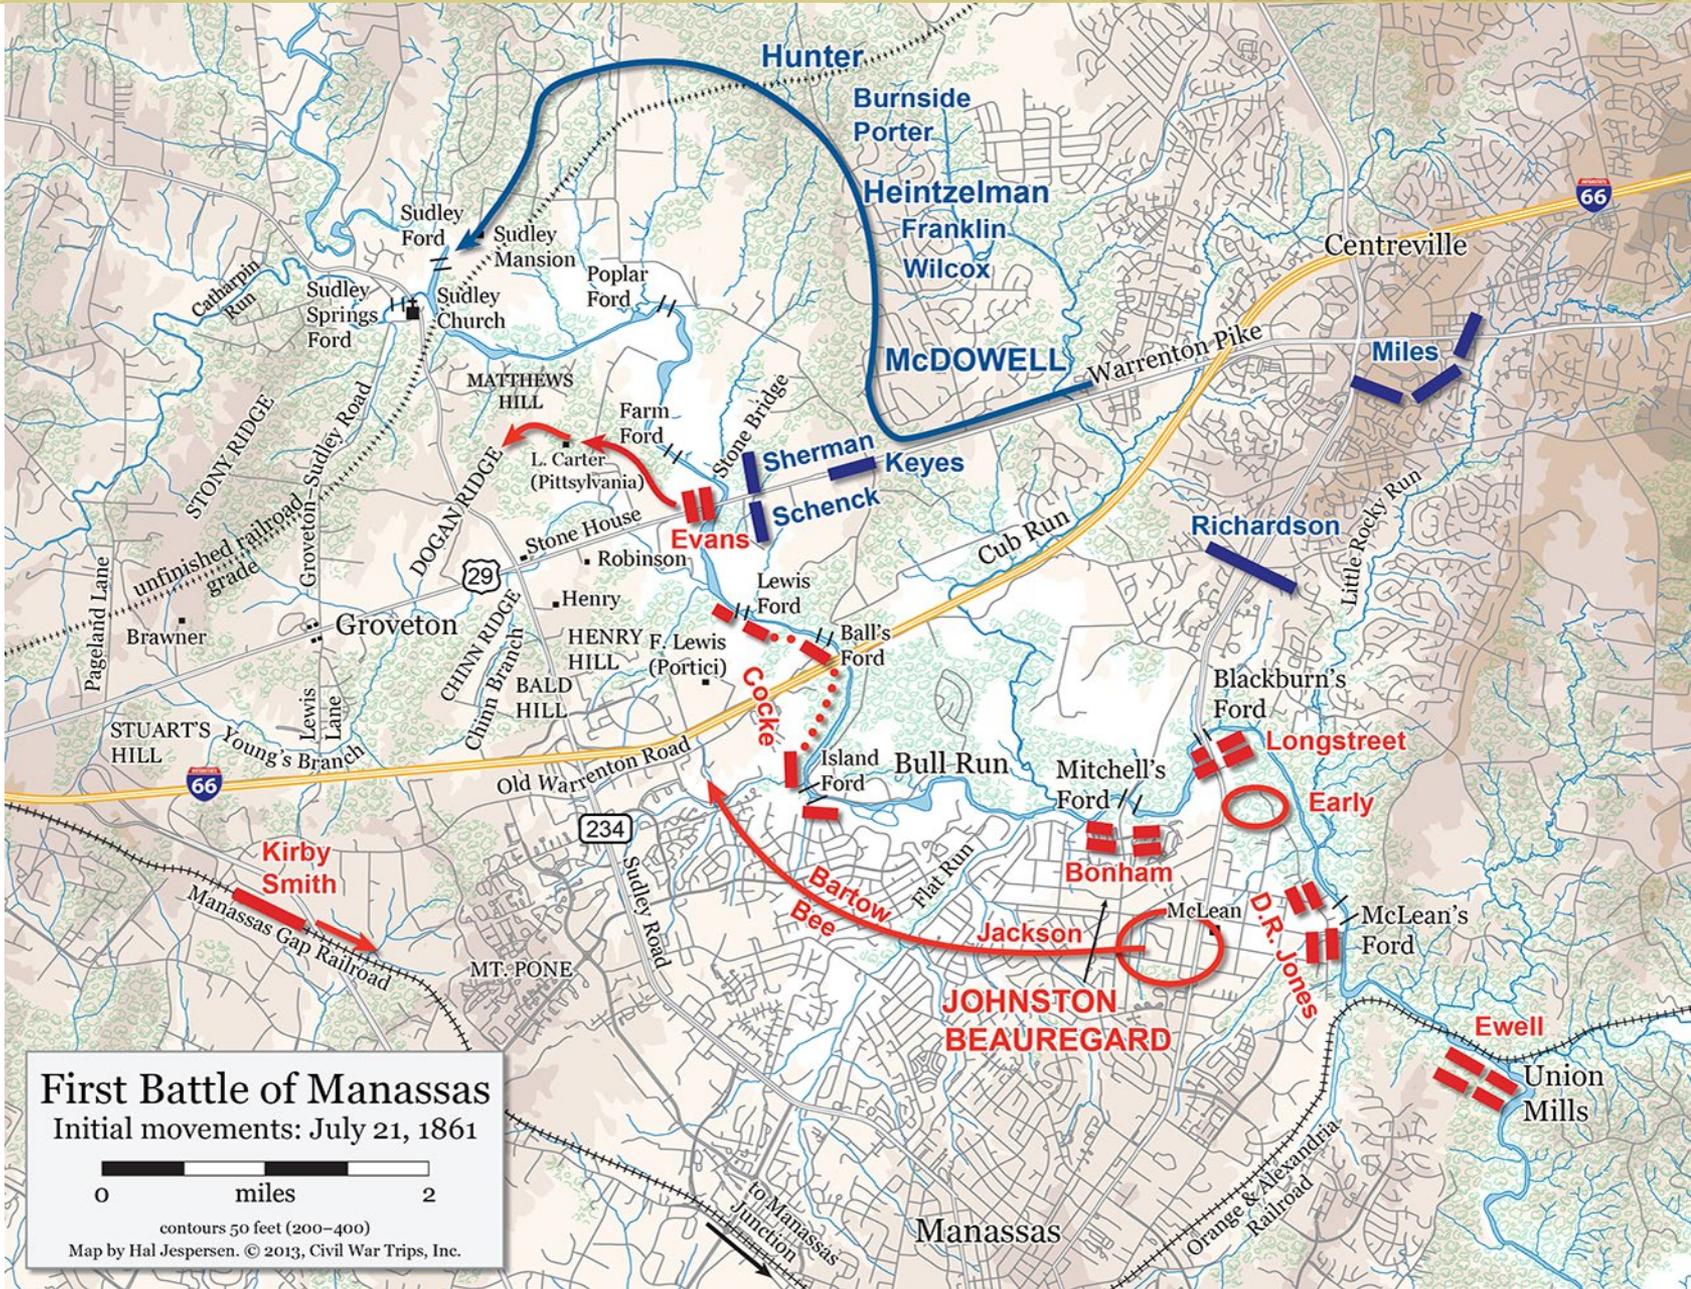

National Land Cover Database

TIGER, III

TIGER, IV

Outline

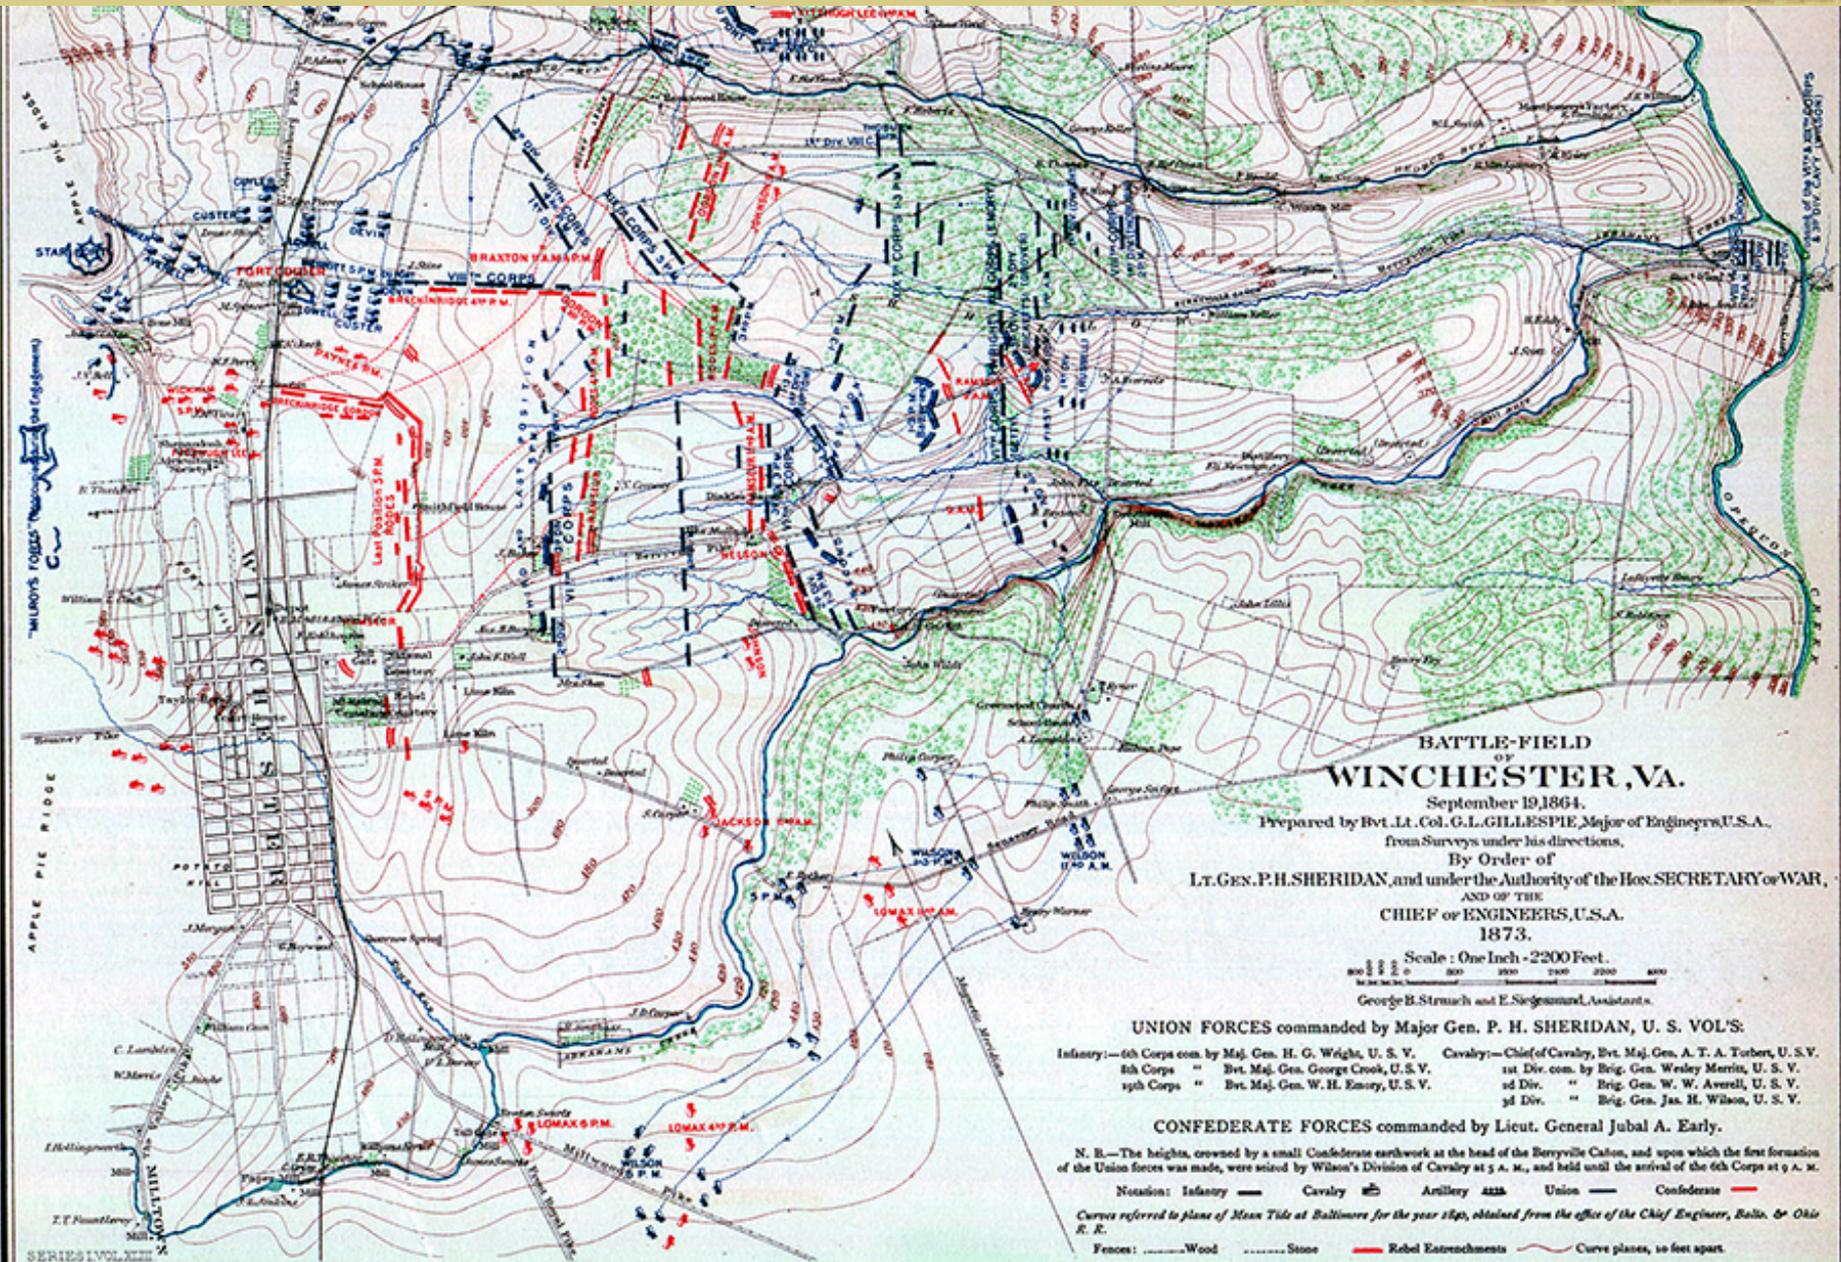

- My history in mapmaking
- Famous cartographers who influenced me
- How I work with authors
 - Determining content
 - Publication challenges and issues
- Mapmaking tools and workflow
- Technical aspects of cartography: projection, elevation, data sources
- **Accuracy of 19c maps**

How to Represent 19th Century?

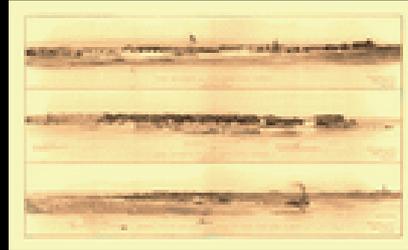

- Lots of things have changed since 1861–65, which makes maps challenging
 - Elevations (freeways and land leveling/filling)
 - River courses (meanders, dams)
 - Tree cover
 - Roads and railroads
 - Town names and boundaries
- Historic maps are usually not accurate enough to translate directly onto the real terrain
- “Geo-Referencing” required

Lt. Col. G. L. Gillespie, USA

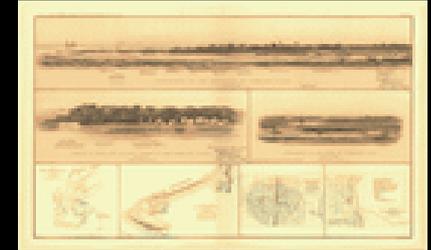

Official Records Atlas

- Now online in high resolution from the Library of Congress

Pl. I: Fort Moultrie, Fort Johnson and Morris Island and Cummings Point

Pl. II: Cummings Point, Fort Johnson, West Virginia, Rich Mountain, Camp Garrett, and Rich Mt. Battlefield

Pl. VI: Washington (DC), Paducah (KY), Mill Springs (KY), Logan's Cross Roads (KY)

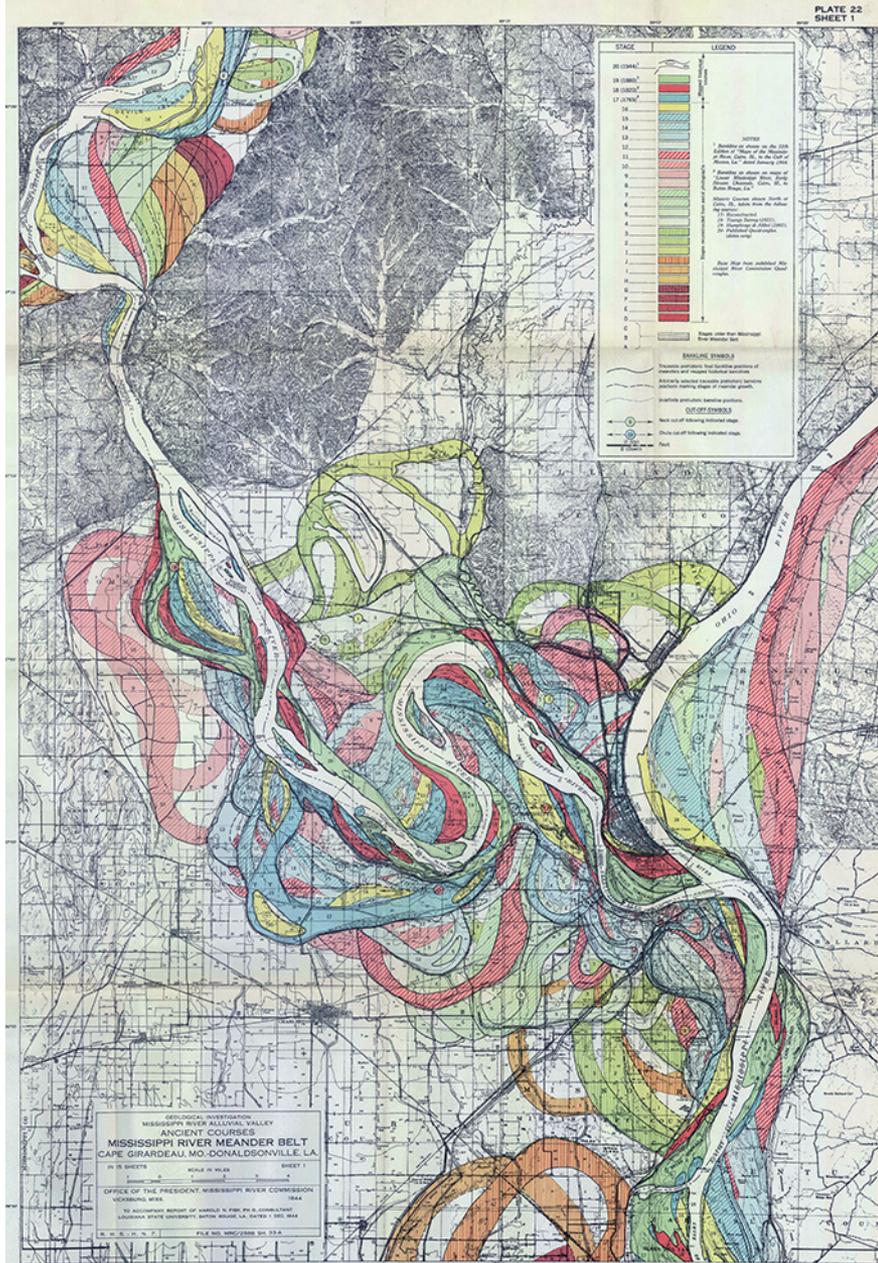

Pl. VII: Northeastern Virginia and the Vicinity of Washington - 1

Rivers

- Most small rivers stick to their valley courses
- Mississippi River the most dramatic example of course changes
- Unfortunately, state boundaries were established at one point in time, and the river has moved on

Harold Fisk's 1944 map

Rivers, II

Battle of Belmont

November 7, 1861

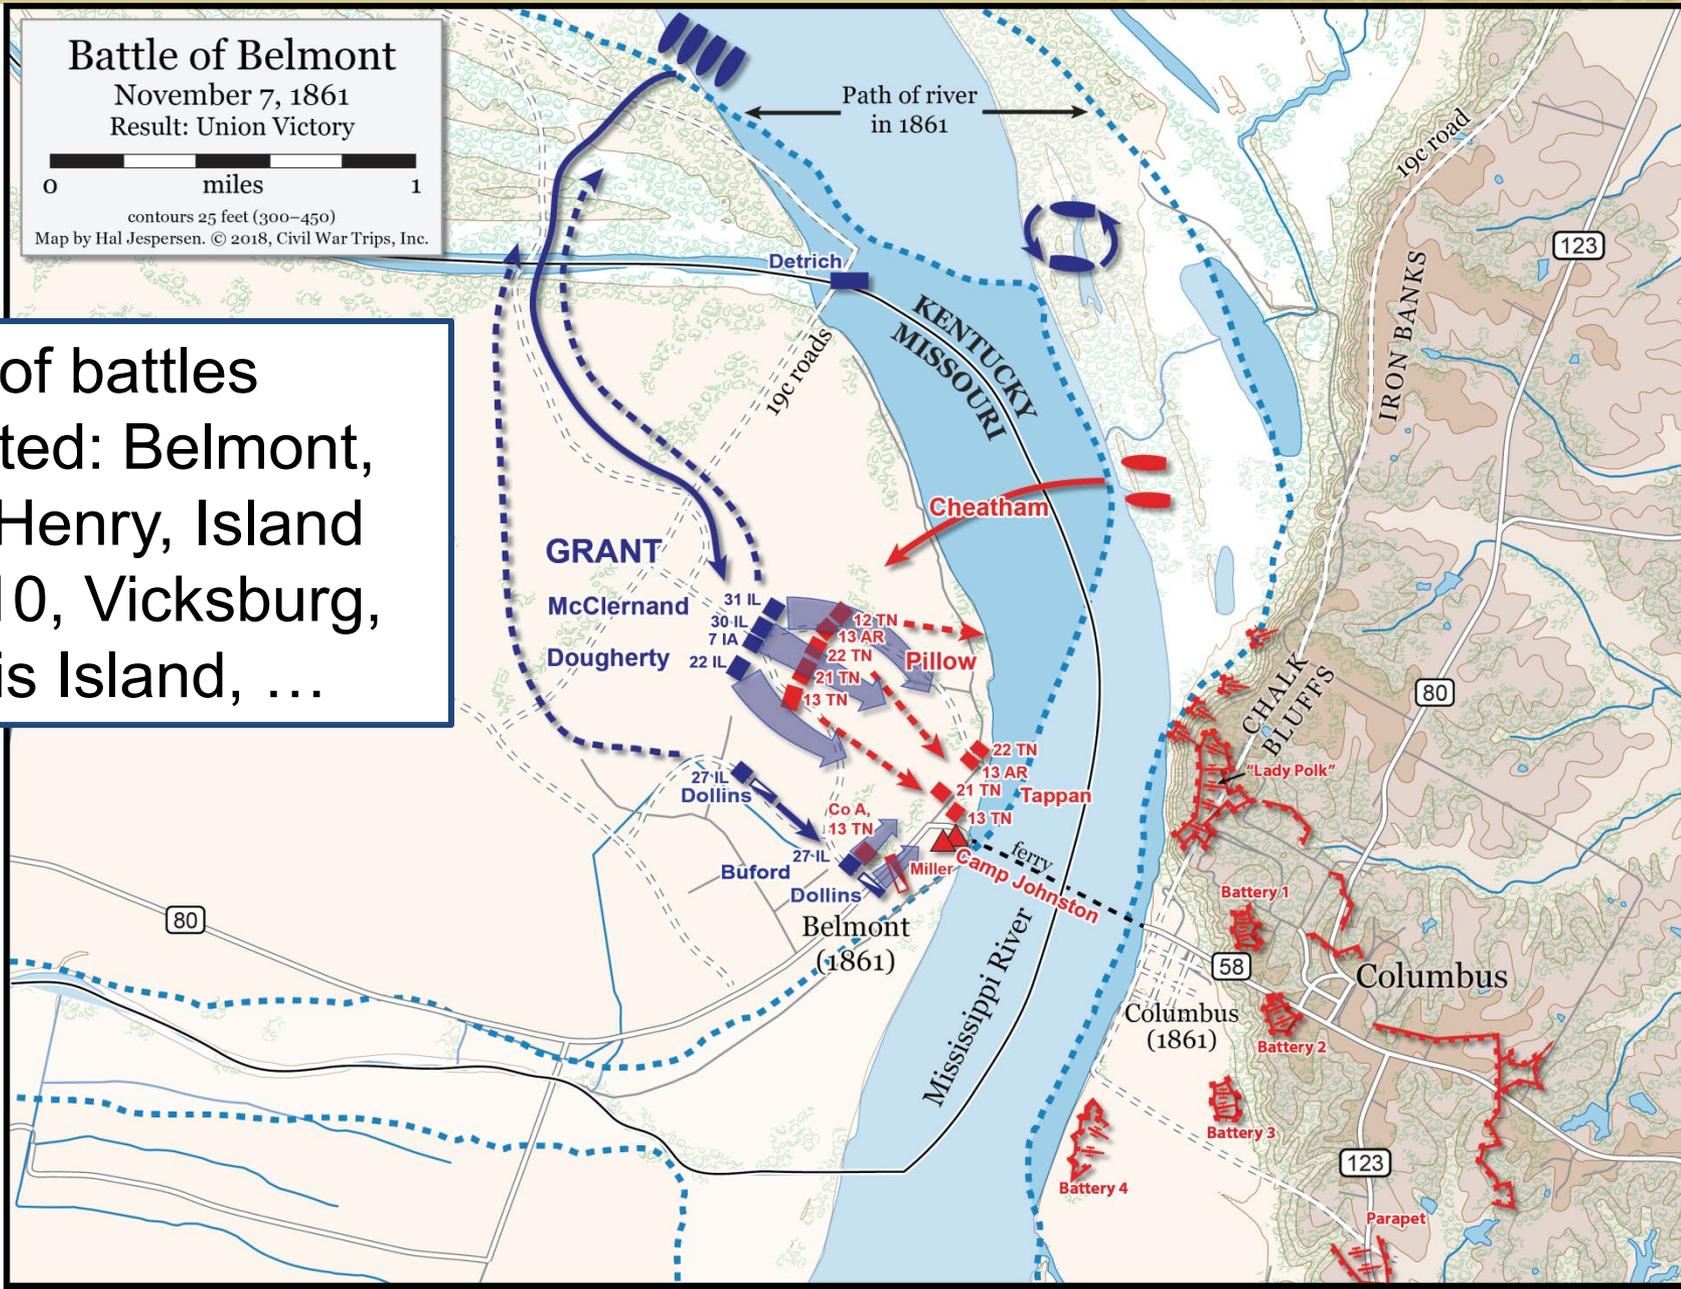

Result: Union Victory

0 miles 1

contours 25 feet (300-450)

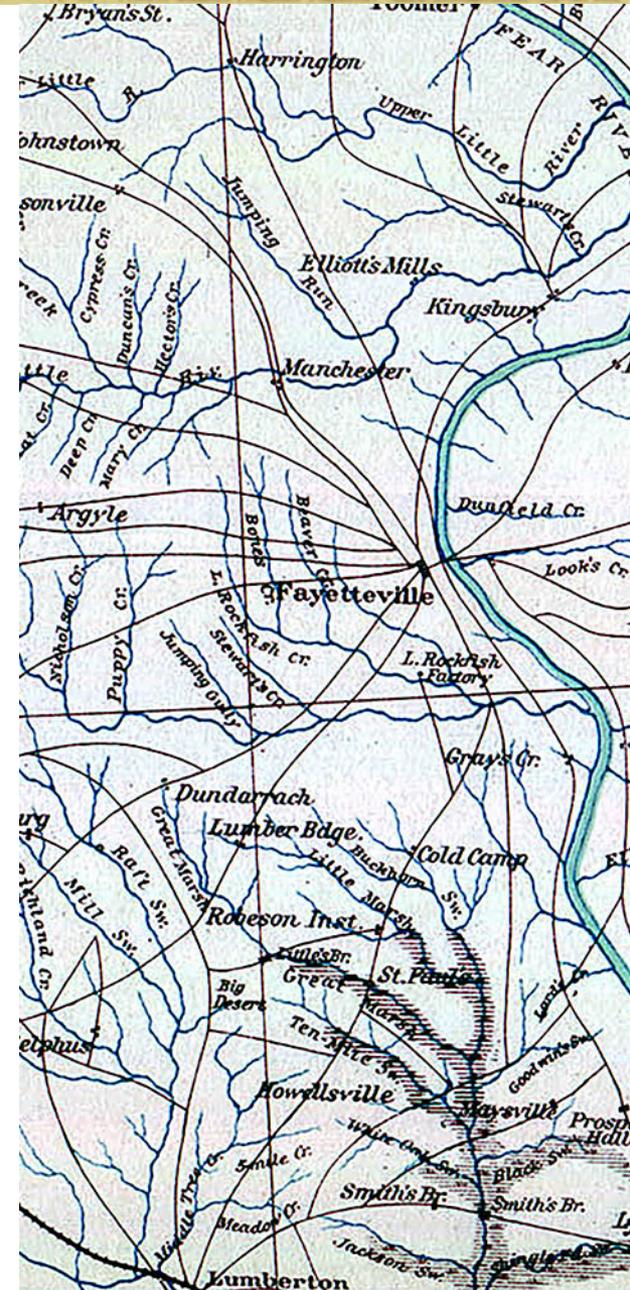

Map by Hal Jespersen. © 2018, Civil War Trips, Inc.

Lots of battles affected: Belmont, Fort Henry, Island No. 10, Vicksburg, Morris Island, ...

Roads and Railroads

- Historic maps are often not accurate concerning roads
 - Stylistic, ignore terrain
- Depending on scale of the map, modern state highways may be useful surrogates
- Railroad tracks are often in the same place

Thank you

- See my maps at <http://www.CWMaps.com>
- CW travelogues at <http://www.posix.com>
 - Friend me on Facebook to hear about updates
- These cartography slides are on the Old Baldy website
